Not to mention that over the same period PC and Mac models were coming
out based on 32 bit processors and VGA graphics pretty much became the
standard. So how does Atari respond? They introduce the STE with the
same graphics modes and processor as the 1985 ST model. The Falcon is
what the STe SHOULD have been (less the DSP and 8 bit sound
instead of 16 bit, although those would have been very innovative
options for the time :-). Atari basically snoozed during the 80s and
let all the competition blow them away. Of course, this still might
have made no difference with the state of Atari computers today.

>could find it? TIA!

Hmm. Instead of using the SCSI bus to read the CDROM (the audio
tracks) and play those out of the Falcon, why don't you get some line-level
leads and feed it into the audio-in ports of the falcon? Then use something
simple to play whatever is on the in-ports out through the out ports. I
think I remember AFM (Audio Fun Machine) used to do this, with the advantage
that since all the sound information stays on the DSP bus, you don't slow down
the rest of the system (Reading from the SCSI port requires that the info pass
down the bus used by CPU, video, etc.). I'm not sure, but depending on the
CD-ROM player, the output may or may not be amplified - if it is an amplified
signal, you will need those line-level cables (with the 100 or so ohm
resistors).

Since I don't actually own a falcon, let alone a CD-ROM, this info
may be slightly incorrect. If so, someone please jump down my throat and
keep this guy from blowing up his computer, his speakers, and the wall next
to the computer. :)

They are getting out of the Atari business, I'm afraid. Last time I was
there I saw no Atari hardware for sale, and I overheard the receptionist
to say they have a few software titles remaining.

Ironically, they still support the Amiga, apparently.

Three Strikes and We're Broke.

>have to buy a special 'multiscan' monitor that will
>support the STs video output.

Some VGA monitors will work as Atari monochrome monitors. I know, 'cause
mine does.

O.K., to tell the truth, it doesn't like the 35 kHz scan rate very much,
but it does manage to display a useable image just the same. I don't know
whether abusing a VGA monitor like this will shorten it's life; that
might be something to be concerned about. (Can anyone answer that one?)
Fortunately, I use a SC1224 most of the time, anyway, so I don't worry about
using my VGA occasionally.

Repeal prohibition.

Why is it that my desktop always boots up in blue, even if i use
XCONTROL.ACC to set it otherwise??

As soon as i use XCONTROL.ACC, the colours think they are green etc. and
when i move the slider, the colour immediately shifts from blue to
green.
<---

That's what NEOCNTRL.ACC is for. Use that to set the colors which will
save into the NEODESK.CFG file, and then you can use the XCONTROL to
save the colours as the system palette.

I hope you don't want to change it from blue to Green?! yecch! :)
```

```
i tried to use the setmatherr() function from math.h. this function is described as
followd:

void setmatherr(int (*errfunc)(struct exception *e));

i wrote a little test program ...

int myerr(struct exception *e)
{

/* do soemthing */

}

void main(void)
{
int a,b,c;
setmatherr(myerr);

a=b=0;
c=a/b; /* division by 0 ==>error! */
}

... when excecuting c=a/b the program jumps in myerr(), but *e contains nothing.
that means e is not allocated. what did i do wrong?
```

It has sound, but I wouldn't quite call it "incredible" since it's all chip generated, and fairly A-Typical of the sort of chip sound you'd hear in a half decent commercial game. I'd have prefered digital sound myself...

Hi Patrick,

Just a thought. Perhaps you could try to use a disk editor to change the filename in the directory and FAT back to something that could be understood by the FS (ie : .do => doc).

I've never tried this on a HD (I haven't got one) but it could be an idea.

No idea how this happened anyway.

Hope this (very little) helps.

Hi!

Who could help me and give me hints to connect a CD-ROM (Apple Power Cd) to my Falcon via Metados? (I'm not much interested in spending money into that combination but I would like to get some sw/pd-progs to make it running.)

Has anybody yet done this?

Together with Winrec 1.8? comes a CD-Player for a CD-Rom which could play Audio-CD's via SCSI but in the readme-file is mentioned that you need another BOS for the Falcon. Is such a driver available as sw/pd or do I have to pay some money for a useable driver?

ThanX,
Christian

0.51?! I am getting slow :) I'll see what I can do. I hope it isn't too
difficult (for me, that is).

Best regards,
Ronald

Hello Tim, There is a bug in ST-Zip 2.5 that wont let you extract the first file of the archive if you highlight it. The best thing you can do is get ST-Zip 2.6 which I have. If you want to call me voice and get it then fine. Or you can get it from any Online service, FTP it or the Local BBS's.

Clifton Mothershed!

|>
Drive U: is my root / (always), but you're right of course. The rlogind
receives the username and the terminaltype. Then a new environment is created
which only holds TERM. The login-shell should do the rest.

This is still a problem though. The login-program starts the shell, but
with UNIXMODE gone this shell can't find the homedirectory and /etc/*
so it can't start as a login-shell (even if argv[0][0] == '-').

I wonder how this problem should be solved.

|> What seems to be the problem is that rlogind doesn't copy IT'S OWN envi-
|> ronment to the child.

You're right, but after looking at the sources I don't think rlogind
*should* copy its own environment.

|> Where do you set your UNIXMODE environment variable -- in mint.cnf?
|> If not try setting UNIXMODE there. Then all processes which don't
|> destroy their own environment will inherit UNIXMODE -- including rlogind
|> and its childs.

Well, basically what happens is this:

char *env[2];

extern char **environ;

setup_term(fd)
int fd;
{
env[0] = term;
env[1] = 0;
environ = env;
}

After that the old environment is gone (of course) including UNIXMODE,
no matter where UNIXMODE is set. The new environment only holds TERM.
```

Rlogind reads its value from the rlogin-client (not shown above).

Without UNIXMODE the shells can't find the home directories and /etc/*,
like /etc/profile and /etc/login.csh. I don't know for sure how this
problem should be solved. I figure UNIXMODE must be saved and put into
the new environment.

Any other ideas?

Bye,
Ronald

You need at least TOS 2.06 (ie a later AES version). However, if you
install a copy of GEMRAM and WINX (2.2), they will allow the use of
wincolor.cpx (and other nifty stuff, too).

You should find them both at atari.archive.

Would these bugs be what causes my MSTE to occasionally fail to recognize the internal floppy when booting up? To be more explicit, once in a while I'll boot up and any attempt to access drive A returns a "drive does not exist" error, and within Selectric the drive selector menu doesn't display A or B. Restarting (warm or cold reboot) fixes the problem.

Well, not quite *perfectly*. It is my understanding that older drivers will not print text at 600x300 dpi, as the 520 is capable of. This won't affect graphics, since they are still at 300x300. Of course, I could be wrong... I don't know much about the custom drivers for the programs you mention.

> market.

Well, the actual reason Word Perfect cited for dropping the Atari version is quite simply, poor sales. At the time there was also a rumor going around that they dropped it because a WP employee found Atari WP on a pirate BBS just shortly after its release but I think that's hokum (not that it wasn't pirated, but that they would drop it solely because of that).

A company like WP has huge overhead expenses and if they release a product they must maintain and support it as well as their other products. The Atari market was just too small to maintain enough sales to keep up the momentum and an acceptable profit margin. And remember, the Atari market was considerably _larger_ then than it is now.

Awww, I never liked WP anyway. :)

I have an Atari 1040 st with color montor for sale. Included with this system is the IMG scanner that can be hooked onto any dot matrix printer. I also have a good deal of software, including, but not limited to:

GFA Basic 3.0
Shadow of the Beast
Sim City
Music Studio
Double Dragon
Blood Money
Karate Kid
GFL Football/GBA Basketball
Bard's Tale
Wizard's Crown
and many others including a good deal of PD stuff...

I also have a couple of joysticks and a lot of STart magazines from the early 90's. I will sell these components for $200 or best reasonable offer.

Along with this, I also have a Yamaha PSR-50 MIDI keyboard with the necessary MIDI cables and Dr. T's sequencing software. I will include these items along with the above listed equipment for $300 or best reasonable offer. Deals are possible for various pieces of equipment, but I would prefer to sell everything at the same time. Mail me for a more complete description of the items available and possible payment methods. Thanks.

> installable version produced? What about a patch? Thanks!

If the disks just have files on them, try copying the files to the root
of one of your partitions; if you run it, and it still tries to access
your floppy disk, you should install the Dabblefeature ACC.

Dabblefeature lets you reassign partitions. For example, I have Ultima
V installed on my K: partition. Ultima V is silly and just ties to
access A:... using Dabblefeature, I can redirect accesses on A: to my K:
partition and run Ultima V with no annoying delays. It still _thinks_
its running off of A:, but when it requests a new floppy in A:, I just
hit enter, because it's still there on my K: drive.

I think Dabblefeature is on atari.archive; it does some other things,
but I only use this feature... ;-)

Nope; .gov, .com, .edu, .mil, etc with no country-code is for the
'states... They get special treatment (presumably because that's where
ARPAnet originated in the pre-Usenet days).

I don't know; they certainly sound more interesting than PCs or Macs.
It's a pity that they don't run something standard like UNIX and that
people are making such a big deal about being able to drop a '486 card
into it... ick.

Does anyone have any SPECint '92/SPECfp '92 for the Acorn RiscPC? I
mean, really, about the only thing keeping me from throwing in the towel
to buy a klone to run Linux on is the fact that the '486 *sucks*rocks*
at floating-point, and I want a system that can raytrace at reasonable
speeds. Hey, if I have to put up with crappy hardware architecture, at
least I could get pretty pictures quick, eh? :-)

Linux for the PowerMac should prove interesting; I wonder how hellish
it'd be to use X with a one-button mouse though...

>Have you seen a 300 dpi print of a Calamus document? It looks awful! Calamus
>fonts are very good for high resolution output but not for devices an average
>user has got at home (OK, some people are rich enough and buy a 600 dpi
>laser...)

This is absolutely 100% *FALSE*!! I've been using Calamus (& now SL) for years,
first on a "360" dpi 24pin, then a 300dpi inkjet, and now a 300dpi LaserJetIII.
In all cases the output is *absolutely beautiful*, positively the best 300dpi
output you will see anywhere! It is far superior to PostScript (and, from what
I've seen, still superior to PS Level 2) or TrueType output. On the HPIII I
frequently have 8.5x11 camera-ready blown up to 11x17 (for use as large flyers
etc...) at print time and it *still looks fantastic*. Sure, this partially due
to the HP's RET, but most of it is due to Calamus...

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's
'Statistics of Deadly Quarrels'. You've probably never heard of it even though
its relevance to the mess you're in is at least as great as that of Darwin's
'On the Origin of Species,' which you learned about in fourth grade. And that's
because it's so completely terrifying only those 'experts' who are adequately
armoured with preconceived contrary ideas which will enable them to disregard
Richardson's work completely ever get to study it."

That and Atari people expect BETTER than Word (IM)Perfect...

Most of the programs that have been cited as 'not selling enough' on
the Atari also suffered from not being good enough! This is mostly
with 'ports to the Atari. The stuff I have reviewed in the past five
years has either been developed for the Atari and good, or ported and
mediocre. Too bad the Atari marketplace wasn't large enough to
support more original software.

49. Re: Dorfman Report..

Newsgroup: comp.sys.atari.st
Date: 1994-07-01 22:02:27 UTC
From: abarbiero@delphi.com
Message-ID: <Jy+QJyr.abarbiero@delphi.com>
Source record: 184395

I saw the Dorfman report, and I can tell you that a 30 second spot on TV is never any replacement for being at CES. These sorts of reports come out all the time for many companies and appeal only to the 30 second attention span of the Wall Street crowd. I worked on Wall Street for a summer in college and wondered how that many greedy, myopic people could work in such small proximity without it being declared a 'brain-free' zone.

Then again, the purposfull deflation of a stock to make a killing on the options market has been known to be done on purpose too.

We used to say that a companies stock price proves nothing but the value of the paper it is written on. TV reporters are all so knowledgeable too.

Atari has some cool things in the works, Wolfenstien 3D is for rent at Blockbuster, Brutal Sports is coming soon, and we can expect two third party games this month.

All this may not be enough to make the Jaguar #1, but then again with the Japanese can any American company be #1 when it comes to consumer electronics???

Andreas@AEO

50. NVDI

Newsgroup: comp.sys.atari.st
Date: 1994-07-01 22:03:51 UTC
From: erichall@io.org
Message-ID: <2v23s7$5gp@ionews.io.org>
Source record: 184399

To say I'm not impressed is an understatement! After all the posts I read claiming NVDI to be the next best thing to a hard drive I simply had to have it. Well..... the results of GEMBENCH are included below and they don't lie (do they Ofir :-). I ran the tests only after a couple of weeks of not noticing any difference at all in any screen displays in any application whatsoever.

Now, initially I thought it was simply my ineptness at installing it, or perhaps a conflict with another Auto prog or Acc, but I've tried this every which way but loose (bare system, no other progs or accs, etc.) and still no luck. Then, I figured the difference on a blittered, 16 MHz Mega STE was maybe so small as not to be noticable, so I tried it on my poor old Mega ST 2 (Tos 1.02, no blitter) and the results were no better. There was visually no perceptible speed up in anything, and again GEMBENCH showed a marginal decrease in performance, rather than an increase in anything at all.

So, where have I gone wrong? Obviously, this is one fine product by the testimony of all other NVDI owners I've seen posted, so it can't be the software, but it sure doesn't seem to want to work for me! Any ideas? Will someone please tell me what an idiot I am and explain what I've overlooked.

BTW Ofir, this is the first time I've used GEMBENCH since the day I picked it up, BUT I promise to register it, _IF_ someone solves my problem and I can use GEMBENCH to prove that NVDI really does speed things up.

What's this about a Falcon warrantee fix for timing problems? How do I get it done?

The changes of my local dealer being able to (or being willing to) do it are slim to none. Knowing Atari, I'd have to send it back to them, let them butcher it, and wait a year or two before I get it back.

Time to buy Diamond Back 3, eh?

Good point, Andreas. Just because our market may be smaller does not
mean we have or will accept lower standards. I think some of the
larger companies like Word 'Im'Perfect :) learned that the hard way.
If their product does not sell I think the knee-jerk reaction is to
blame it on the small market and/or rampant piracy when all along it
may have been garbage under the shrink wrap to begin with.

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decomompression program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities

- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

: Very few things run at a respectable speed on an 8Mhz 68000 (MicroEMACS
: does, Ultima V does, POV-Ray sure doesn't)...

By 'respectable', I meant, 'not crawl'. Like, faster than 4.x. Like, can fill a screen with text in less than, say, 5 seconds like Atari Works does.

: > 2) Why the *^&^*&^ doesn't it support Calamus fonts?

: Calamus fonts don't support hinting, and they're even more non-standard
: than Speedo fonts... After listening to all the complaints about
: Speedo, would _you_ want to support another one-vendor-only font
: "standard"?

Actually, the professional font foundaries produce many of the Calamus fonts, I think. The Calamus fonts are of the highest quality, just as good, if not better, than the competitors. Plus, there are countless PD Calamus fonts. We have 4 megs of them. I'm told that hints aren't used on the printer, which makes sense for sizes large enough that you can read on a 300 DPI printer, and they're not THAT bad looking on the screen.

It is my understanding that hints are just to make repairs to slight imperfections in the way the characters turn out at very low resolutions (like on the screen). Well, perhaps I'm wrong, but I figure that someone could write a font driver that didn't suffer from these drawbacks... like take a slightly different approach to how the characters are imaged on the screen.

And what exactly to hints specify? Extra bezier curves? Individual points? Bitmaps?

: > 3) If there is a FPU installed, does it detect it and use it, or is that
: > pointless because of the design?

: I sure hope it does (no that I have an FPU in my ST, but TT and Falcon
: owners with them would certainly benefit from the extra boost)...

Maybe Compo will answer this question for us.

Thank you thank you. Finally someone with a head on his shoulders. Yes, the output we get from Calamus is absolutely the best I have ever seen. We're accustomed to pages printed at 1200 and 2400 DPI onto film, so we kinda gag when we see output from a 300 DPI lazer printer, but Calamus does a FAR better job than anything else I've seen at 300 DPI. 300 DPI is ALMOST tollerable when printing with Calamus. With anything else... ICK.

We did have problems outputting to an HP deskjet 500C, but then again I've never seen ANYTHING look good coming out of a 500C. At 300DPI, the line screen is HUGE, and Sean didn't want to take the time to adjust the colors so they'd come out optimally.

The output to an HP4 at 600DPI is excellent, but if the printer only has 2 megs of RAM, it's very slow because the data has to be very well compressed to fit into that space.

If you want to see 1200 DPI b/w and 2400 DPI color, check out the first issue of Processor Direct magazine. I'm no expert on layout, graphic design, or general desktop publishing (i'm technical editor), but I know what I see, I know what I like, and I like what I see.

57. Atari-Works/GDOS/Printing

Newsgroup: comp.sys.atari.st
Date: 1994-07-01 23:28:56 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <2v28ro$7fv@golem.wcc.govt.nz>
Source record: 184305

Is it possible to print anything with Atari-Works using standard GDOS (Or, at least, the one in NVDI v2.50), or is Speedo-GDOS or some specific printer fonts required, as it keeps saying "No printer fonts" when I try & print anything from it, which was annoying after sticking over 100 reasonably detailed entries into a database I wanted printed out for reference. I ended up saving it in DBF format and printing it from Microsoft Works on a PC. (Which was on a laser-printer as opposed to my grotty old Dot-Matrix, so it wasn't all bad! :)

>Is there a history file about different TOS versions ?

Here is the ony and only existing history from ATARI:

Towns' Little Guide to TOS Revisions, version 1.0

Written by John Townsend, Atari Corporation

This is a small document that explains in very terse terms the
differences between the TOS revisions available for ST/MEGA/STE/
Mega STE/TT machines, what patches are needed for what revisions, the
formats they are available in, and any notes I can think of.

I hope this will clear up some of the confusion with the different
TOS versions. If you have any questions on this document, please
let me know here on GEnie. My GEnie Address is: TOWNS.

Special thanks to Leonard Tramiel, Allan Pratt, and Doug Wheeler
for their involement with this little Document. Thanks again!

Comments are welcome..

-- John Townsend
Atari Corp.

==========

ROM TOS (TOS 1.0)

The original ROM TOS, this version shipped in 520ST and 1040ST
machines. It is no longer shipping in any machines.

Formats: 2 chip ROMs, 6 chip ROMs

Machines: 520ST, 1040ST

Utilities: FOLDRXXX.PRG

FOLDRXXX.PRG will add more entries into your OS Pool.
In TOS 1.0 and TOS 1.02, the limit for the number of
directories that you can enter is around 40. With this
program you can extend that limit much higher. If you
are using a hard drive, this program is recommended
highly. It will work with all TOS versions and will
improve the performance of your system.

Notes: GET TOS 1.04 TODAY! TOS 1.04 is the latest version of TOS
for 520/1040/MEGA owners. It is MUCH faster, has faster,
better disk I/O, many other improvements.

MEGA TOS (TOS 1.02)

This is commonly referred to as MEGA TOS. This version of TOS fixes
some minor problems in TOS 1.0 and has support for the BLiTTER chip
and Real-Time Clock chip.

Formats: 2 chip ROMs, 6 chip ROMs

Machines: 520ST, 1040ST, Mega 2, Mega 4

Utilities: FOLDRXXX.PRG

FOLDRXXX.PRG is explained above.

Notes: See notes for TOS 1.0.. GET TOS 1.04 TODAY!

Rainbow TOS (TOS 1.04)

TOS 1.04 or Rainbow TOS, as it is commonly known is the latest
version of TOS available for 520/1040/MEGA owners. It has been
available as a dealer upgrade for awhile now. It has much more
robust Disk I/O, Autorunning of GEM programs at boot up,
a fix for the 40 folder limit, and much more. Most of all is
it much faster than previous versions of the Operating System.

Formats: 2 chip ROMs, 6 chip ROMs (available as Upgrade!)

Machines: Stacy

Utilities: TOS14FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG

TOS14FIX.PRG solves some small problems in the AES (for
additional information, please see the documentation that
accompanies the TOS14FIX.PRG program).

POOLFIX3.PRG fixes a bug in GEMDOS. Documentation that
accompanies the POOLFIX3.PRG program explains (in detail)
the problem that it fixes.

CACHEXXX.PRG is a new program that adds GEMDOS buffers
to your system. The caching of data and disk directories
by GEMDOS (when this program is used) will result in
your system running much faster! This program is highly
recommended and requires TOS 1.04 or higher for full
benefits!

FOLDRXXX.PRG is explained above.

Notes: Please use the utilities available and if you haven't
upgraded to this version of TOS yet.. please consider
doing so. It's a very worthwhile upgrade.

There are some disk-based versions of _early_ developer
only releases of TOS 1.04 floating around on BBS systems
here in the United States and abroad. Please don't use
them! They are bad news! They have some very nasty bugs
and have been known to corrupt data!

STE TOS, Rev 1 (TOS 1.06)

TOS 1.06 is the TOS version that is shipped with the 1040STE and
520STE machines. It is essentially TOS 1.04 with support for the new
hardware that the STE has.

Formats: 2 chip ROMs

Machines: 520STE, 1040STE

Utilities: STE_FIX.PRG, POOLFIX3.PRG, CACHEXXX.PRG, FOLDRXXX.PRG

STE_FIX fixes the infamous Desktop Medium/Low resolution
bug. The problem is that there is a bug in the desktop
code in this version of TOS that prevents the user from
booting into Medium Resolution. The patch program STE_FIX
will solve the problem. Once it is executed in the AUTO
folder, the problem no longer exists.

FOLDRXXX.PRG, CACHEXXX.PRG, and POOLFIX3.PRG are
explained above.

Notes: This version is only available in 1040STE and 520STE
machines. It isn't available for upgrading. It won't
work in older machines.

STE TOS, Rev 2 (TOS 1.62)

This is a slightly revised revision of TOS 1.6. It fixes the POOLFIX
problem in GEMDOS and the problem in the Desktop that was present in
TOS 1.06.

Formats: 2 chip ROMs

Machines: 520STE, 1040STE

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only available in 1040ST and 520STE
machines. It isn't available for upgrading.

Mega STE TOS (TOS 2.05)

TOS 2.05 is the version of TOS currently shipping in the Mega STE.

Formats: 2 chip ROMs

Machines: Mega STE

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only available in the Mega STE. It isn't
available for upgrading.

TT TOS (TOS 3.01)

TOS 3.01 is the version of TOS that originally shipped in the TT030.

Formats: 4 chip ROMs

Machines: TT030

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only avaible in the TT030. It isn't
available for upgrading.

TT TOS (TOS 3.05)

TOS 3.05 is the latest version of TOS currently shipping in the
TT030.

Formats: 4 chip ROMs

Machines: TT030

Utilities: CACHEXXX.PRG, FOLDRXXX.PRG, SERPTCH1.PRG

CACHEXXX.PRG and FOLDRXXX.PRG are explained above.

Notes: This version is only avaible in the TT030. It isn't
available for upgrading.

Steve Wells (wells_s@ix.wcc.govt.nz) wrote:
:] I'm currently searching an util that permit to expand the memory of
:] my MEGA ST by this way :
:]
:] have virtual memory as a file on hard disk

: It can, and has, been done on an XT (8088 @ 8Mhz), So I'd be surprised
: if say, a 1040STE couldn't handle it, but there are no PD programs around
: that will do it! :(

The kind of virtual memory you're probably referring to is the kind where the application asks the OS for memory every time it needs to access it, so the OS can swap it to disk if necessary and allow another app to use that space. Whenever the app wants to access its allocated RAM, it asks the OS for the memory location, which may have changed, locks it, uses it, then unlocks it so the OS is free to swap it.

The 8088 has absolutely no facilities for virtual memory. It has no way of aliasing memory access so that access to a non-existent location is redirected to a real one or the OS is called to retreive it from disk. The 68000 doesn't have this either.

The first 680x0 to support virtual memory was the 68010, and the first iAPX processor to support it was the 80386.

Windows on the 286 did some swapping, but that was just segments of application code from the executable file on disk... this application code swapping method has been used since the beginning by the Mac's OS on the 68000. Hence the 32k size limit on code resources so PC-relative code could be moved anywhere in RAM and still run without modification. It's a wonder that the Mac with a facility for swapping code segments in and out of memory, it doesn't have dynamic memory allocation. Very odd.

I once thought about writing a virtual memory manager for the ST. I figured that I could trap accesses to memory past the 4 meg mark. The only problem is that I'd have to trap every single access, which would cause TREMENDOUS overhead, and may not be feasible since I'd really be trapping bus errors. Somehow, I'd have to figure out how to get the data to the right place and then return to the running program. The exception overhead alone would be tremendous, for each and every memory access, and then to figure out where the data should go to and come from would require my program to emulate the instruction that errored with the memory accesses redirected. It would be almost as bad as running the processor in trace mode. For that matter, you couldn't use it for screen RAM, you couldn't read or write to/from it with the disk, and any computations that used it would be extremely slow.

Now, with a little additional hardware, you COULD do it. Basically, a memory manager on an external chip that could be accessed like an I/O device and instructed to redirect memory accesses. When the CPU accessed a region of memory that didn't exist or was swapped out, the chip would have to cause a bus error, just like the GLU does on the ST with a memory location it doesn't like... there's no other way to tell the 68000 that the memory location is bad when you're telling it from the outside. But you still couldn't do DMA access to any of this memory, which means that the I/O routines in the OS would have to read/write to/from a buffer in un-swappable ram and then copy to the correct place (and the VM manager would handle the swapping).

So, basically, it's a mess. :)

60. Re: 3D stereogram things

: those 3D stereograms? A mate of mine says he /thinks/ there is, but
: he's not sure. An ftp site and directory would be useful,
: Thanks,

AAAAAAAAAAAAARRRRRRRRGGGGGGGGHHHHHHH!!!! I HATE VI!

<ahem>

Anyhow, the program's called STIS, and it's written my a friend of mine named Phillip Oneal. I think you can get the program on GEnie.... and I'll see if I can get his mailing address. It's a nifty program that creates random-dot stereograms, and he figured out how to do it himself.

The only problem with it is that I ALWAYS see stereograms backward. He can see them both ways, and most people see them correctly, but me.... everything that's supposed to stick out sticks WAY in, and vice versa. He and I sat down and stared for quite some time and he tried to help me to figure out how to see it right, but I just couldn't. As a result, I'm blind to all these stereograms that I'm so facinated by. And I'm not just talking about STIS stereograms... i see them all backward.

Hi,

I am hoping that someone can help me with this problem; I want to add items to an existing object tree. For example, I load the resource file into memory using rsrc_load() and then decide that I want to add twenty icons to the first tree. The objc_add() call is none too specific about how this is done. Could someone explain the process to me in detail? I would really appreciate it.

In a message dated 6-29-94, Timothy Miller said:

"You couldn't replace one of the processors or change the
I/O structure without EVERYTHING breaking. Without an OS,
the Jag's going to find itself backed into a corner."

Keep in mind the Jaguar is first and foremost, a game machine. The
only other "game machines" I know of the have an OS are the 3DO
machine, and Commodore's CD-32.

Traditionally, game programmers have always ended up hitting the
hardware...on any machine, whether there is an OS or not. So why
bother developing an OS for a game machine that many developers will
bypass at least in part, endangering any "OS compatible" hardware
upgrades you might have in mind?

If you look at history, game machines have been "disposable technology".
I suppose part of that is because people looking to buy a new machine
have already "played out" all the old games they have, or they simply
keep the old system as well (since the machine itself is typically a
fraction of what they have spent on firmware).

The only case I can think of where we saw built-in backward-compatibility
in a game machine was the Atari 7800's ability to use 2600 carts.
There were add-ons to use older carts (the 2600 add-on for the 5200,
the Sega Master system add-on for the Genesis), but no other built-in
backward compatibility.

Has anyone managed to get this demo of Lexicors 24-bit morphing package
to work? No matter how I try to get it working on this TOS 1.06,
STE (with 2meg), it just bombs before it even initialises!

~$100 is pretty steep for this type of program, especially as there are
PD/SW programs for the PC that do the same thing for nothing!

Is the PATH statement in the ASSIGN.SYS file correct and is the ASSIGN.SYS
file in the root directory ? Are all NVDIDRV*.SYS files in the GEMSYS-Path
as stated in the ASSIGN.SYS file ?

Did NVDI print its startup-messages when the system booted ?

You really should try it with a bare system, only NVDI in the auto-folder.
But there should be no problems when booting up a 'full system'.

There must be a fault in your installation, NVDI should at least do a
speedup of factor 2-3 to your system. (And you will even notice it without
GEMBENCH :-)

Greetings, Karsten

Steve,

the demo of Metamorphosis is an FPU Version only, I wasn't aware of
that until a few days ago where I renamed the file to morph882.zip. It means
that unless you have an FPU you can't run this particular demo...

I will upload the non-fpu versio as soon as it becomes available.

>
>~$100 is pretty steep for this type of program, especially as there are
>PD/SW programs for the PC that do the same thing for nothing!

The Special is for 79 U$D, also it is currently the only program of
it's kind (2D Morphing) to be available commercially (or PD?). And even
though there may be PD SW on a PC that does that kind of stuff, it is

1. for a PC :)
2. Not necessarily as good
3. There ARE also PC Programs that do the same thing for around the
same price or more.

I will let you and others know as soon as the non-fpu version becomes
available and you can check out the demo yourself.

Cheers

Yat @ Lexicor

72. Re: GFA Basic on Falcon?

Newsgroup: comp.sys.atari.st

Using bios/xbios calls, you can do whatever you want with your Falcon,
even play digitized sounds. However, there's still no Falcon specific GFA Basic version, so you must work in ST-MID/LOW res, and be very clean...

The GFA-editor itself only runs in ST resolutions - eventhough someone
has coded a patch allowing it to be run from any Falcon rez, but I don't remember where
to find this patch - , but your GFA program may and can use any of the Falcon rez.

```
E.g.:
reserve -1
reserve 200000
old_res& = xbios(88,-1)
old_log_screen% = xbios(3)
old_phys_screen% = xbios(2)
new_rez& = $20+$8+$4
~xbios(5,l:0,l:0,w:3,w:new_rez&)

and, before exiting from your program :
~xbios(5,l:old_log_screen%,l:old_phys_screen%,w:3,w:old_rez&)
reserve -1
...
edit
```

The DJ520 prints at 600x300 only for its INTERNAL fonts. ANY
graphics printing (including EXTERNAL fonts from a word
processor or DTP program) is still limited to 300x300.

I became an Atari developper a year ago, and it cost me 2000FF, which is around 350-400 $. Now, I don't know if prices hace changed. Don't think you'll get a fantastic documentation. You'll get - except if they changed it - only upgrades between ST docs and STe/Falcon docs ! Which means you only get NEW system calls ! But it's quite cheap compared to the price of an Apple developper registration - I'm not an Apple dev ! -

80. Script 3.5 printing problems

Newsgroup: comp.sys.atari.st
Date: 1994-07-02 11:57:17 UTC
From: bourlon@gla.ecoledoc.ibp.fr
Message-ID: <2v3kmt$51v@vishnu.jussieu.fr>
Source record: 184329

Hello. I bought Script 3.5 2 weeks ago, and I tried to print with it. I use a Falcon 4/65 TOS 4.02, a Canon BJ200, and, with the 'bubble' driver, with the 'ca360360' driver, or even with Speedo, I can get anything else than control codes. The text printing - not 'graphical' - works fine, but it's impossible to get something good with the graphical printing. Can somebody help me ? I'll do some deeper tests, and maybe it'll work....

Please answer to my account, as I don't have much time - except today - to scan through the news list...

81. STReplay/Drumbeat questions

Newsgroup: comp.sys.atari.st
Date: 1994-07-02 12:05:52 UTC
From: ggreenbe@rodan.syr.edu
Message-ID: <2v3l70$e65@newstand.syr.edu>
Source record: 184328

Does anybody out there use STReplay or DrumBeat, the drum machine that came with that package?

I just figured out the midi relation to the sampler and figured out how to use samples on my midi keyboard. I also see how to use these samples in DrumBeat. What I'd like to be able to do is a couple of things:
1. Convert the songs created in DrumBeat into midi files.
2. Trigger the samples in Replay from within a sequencer.
3. Load the samples from Replay into my keyboard/synth.
Does anybody know if any of these things can be done? I guess the first one is probably not very useful withouth one of the others, but it might produce something.

Also, my copies of these programs is rather old (this is STReplay VIII). Are there perhaps newer versions of the software? And are they still supported?

Thanks for any info on these topics.

Message-ID: <2v3sq7$5te@usenet.INS.CWRU.Edu>
Source record: 184331

After the grandkids left yesterday, my wife started playing Starball
since it was still up on the Falcon and got a high score of
61,362,800!
We made a disk for the kids to take home and it wouldn't work on
a 1040 with TOS 1 until we unhooked the hard drive. So maybe
that will help some other people out there who haven't been able
to make it work.
It sure is a great game. Very addictive.

|_____| |_| |_| |_____| |_| \___| |_________________________________
```

-=-=-=-=-=-=-=-=-=-=-=-=-=-=- July, 1994 -=-=-=-=-=-=-=-=-=-=-=-=-=-=-

+++ Please distribute to BBSs, computer systems, user groups, etc. +++

The Atari Community is made up of individuals that are enthused about Atari
products more than anyone is enthused about anything! In order to see this
enthusiasm, all you would have to do is read an Atari discussion related
bulletin board or Atari publication. Some members of the Atari Community
have even been a part of the community for 10+ years! Now that is brand
loyalty! And that is pretty amazing!

There is just one thing that surprises me about the Atari Community. If
there is a software title that everyone would like to see for their computer
or video game system, they will talk with each other about how they would
like to see it for their Atari system, but they don't do anything about it.
They seem to think that if they make a comment on a bulletin board about how
a certain game is coming out for another system but not for Atari's system,
someone will see this message from the company and then start writing the
game for Atari's system. Hahaha. That won't happen.

The only way to get something you want for your system is to let the company
know that you want it. A lot of people assume that companies know what is
in demand and how much it is in demand. I have a degree in Business
(Management & Marketing) and I know that this is not true. Most companies
do not know how much a product is in demand. A lot of companies rely on
consumers to inform them.

There is no secret that the Jaguar's success (and Atari Corp.'s future)
rides on the games being released for it. And even though some of the games
being released for it are impressive, I don't think they are enough.
I'm getting the same feeling I had with the Lynx, some great games for it,
but lack of big name companies supporting it and big name titles being
released for it. But I feel partly responsible for the Lynx's shortcomings.
This is because I never wrote third-party game companies telling them that
I wanted to see them make games for the Lynx. I never told them that if
they make a specific game for the Lynx, I would buy the game. Yes, I am
guilty. I just sat there and hoped. How about you?

If you want to see big name companies and big name titles for the Jaguar, join in with this letter writing campaign. I'm participating in this campaign for three reasons: 1) I really think that my letter will make a difference in the decision making process at these companies. 2) I don't want to think "what if" in the future. I want to do my part now so I can say that I did my share. 3) It is my duty as a consumer to let companies know so I can satisfy my needs (or wants).

I hope you will see a need to participate in this campaign as well. And just don't say to yourself that you will write these companies, make sure you write these companies. Make it a priority in your already busy life. Print this out and write the companies.

Thank you.

Sincerely,

Len Stys

aa399@cleveland.freenet.edu
Cleveland Free-Net Atari SIG Manager
CAIN Newsletter Assistant Editor
A.C.T. NOW Organizer

There are FOUR letters to write. Its important!

1ST LETTER

As of July 1, 1994, Mortal Kombat II is not being produced for the Jaguar. And Acclaim has no plans to produce Mortal Kombat for the Jaguar. But next year, Williams will be able to release Mortal Kombat II for any game system that the company wishes to release it for. The time is now to let Williams know that we want to see Mortal Kombat II for the Jaguar.

Mortal Kombat II is by far the #1 wanted game for the Jaguar according to the Most Wanted Games for the Jaguar list by CAIN Newsletter. If this game is released for the Jaguar, the name "Atari" will once again be a household name.

The letter to Williams should include:

Dear Sir or Madam,
1) How much you enjoy Mortal Kombat II at the arcades.
3) How you like the games that Williams makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get the game for the Jaguar as soon as it is released.
6) A thank you to the person reading your letter and for considering making Mortal Kombat II for the Jaguar.

The address of Williams is the following:

Williams/Bally/Midway
Attn: Console Software Development
3401 North California Ave.
Chicago, IL 60618-5889

2ND LETTER

Electronic Arts is the publisher of some incredible games such as:
NBA Showdown, FIFA International Soccer, PGA European Tour Golf,
NHL Hockey '94, Wing Commander, Super Wing Commander, John Madden NFL
Football, Escape from Monster Manner, Twisted, Mario Andretti Racing,
MLBPA Baseball, and many more! Electronic Arts also owns several other
software companies that they may give the OK to develop the Jaguar for if
they see there is a demand for Jaguar games.

Unfortunately, Electronic Arts is also a major backer of 3DO, a company
that is a big competitor of Atari Corp.. Electronic Arts is spending a lot
of time and money on making games for 3DO that it could be spending on
the Jaguar.

There is hope though! Electronic Arts is a licensee. This means that the
company has Jaguar developers units. Electronic Arts' management just has
to give the OK to make games for the Jaguar.

The letter to Electronic Arts should include:

Dear Sir or Madam,

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your 8-bit Atari
since the company was started (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
5) The games that you would love to see on the Jaguar (choose two or
three Electronic Arts games).
6) How you believe Electronics Arts' games will be unbelievable when
using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games if they produce
them for the Jaguar.
8) A thank you to the person reading your letter and a thank you for
considering producing games for the Jaguar.

The address of Electronic Arts is:

Electronic Arts, Inc.
Attn: Production Teams
P.O. Box 7578
San Mateo, CA 94403-7578

3RD LETTER

Capcom is known for producing the Street Fighter II series of games. The company is also known for producing games such as The Great Circus Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday Night Slam Masters. The company also does conversions of popular titles such as Wizardry V and Eye of the Beholder.

Super Street Fighter II is second only to Mortal Kombat II on the most wanted games for the Jaguar CAIN Newsletter listing. If the game existed for the Jaguar, it would no doubt sell a lot of Jaguars. But Capcom is not making Super Street Fighter for the Jaguar and no plans have been announced to do so in the near future.

The letter to Capcom should include:

Dear Mr. Tresidder,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II for the Jaguar as soon it is released.
6) A thank you to the person for reading your letter and for considering making Super Street Fighter II for the Jaguar.

The address of Capcom is:

Capcom USA Inc.
Attn: Mr. Corey Tresidder
475 Oakmead Parkway
Sunnyvale, CA 94086

4TH LETTER

Atari Corp. recently announced an agreement which will use Phylon's voice-data modem technology into a Jaguar Voice/Data Communicator. This Jaguar modem will allow Jaguar game players to play against or with friends that might be miles away. And it will also allow game players to talk with their friends while playing with them.

There are a few announced games that will use the Jaguar Voice/Data Communicator such as Club Drive and DOOM. But there is really no reason why ALL Atari multi-player games cannot use the Jaguar modem. Checkered Flag, Kasumi Ninja, Spacewar, Star Raiders 2000, and all future Jaguar games that are at least two player should allow for Jaguar modem play. Atari Corp. should also be doing everything it can to interest third-party software companies into making use of the Jaguar modem.

Modem games and networking games is the next generation of video gaming. Virtual Reality is still a few years away, but modem and networking games are here and now.

The main goal of this letter should be to convince Atari Corp. that the company should take steps to make all future games so that they utilize the Jaguar's Voice/Data Communicator.

The letter to Atari Corp. should include:

Dear Mrs. LaBrec,

1) How much you enjoy the Atari Jaguar.
2) How much you enjoy modem games.
3) How you believe that modem games/networking games will be an important part of the video gaming future.
4) How you would like to see ALL Jaguar games make use of the Jaguar Voice/Data Communicator or Jaguar modem.
5) How you believe that Atari Corp. should be working closely with third-party game companies to make sure that they make use of the Jaguar modem in their games.
6) How you will be more willing to buy Jaguar games that make use of Jaguar modem/networking.
7) A thank you to the person for reading your letter and for considering your suggestions.

The address of Atari Corp is:

Atari Corp.
Attn: Sandy LaBrec
1196 Borregas Avenue
Sunnyvale, CA 94089

It is imperative that you write all of these companies. Even if you do not care for fighting games, you are still encouraged to write Williams and Capcom because these companies will help get other games for the Jaguar.

And lastly, please spread this information text-file around! Give it to your friends and have them write too! In order for this campaign to be effective, hundreds if not thousands of letters will need to be sent to each of these companies. It is possible for this to happen!!! You will just need to help get the word out about this writing campaign.

THANK YOU!

Looks like having `hostname` in /etc/hosts.equiv, which is not consulted
for root for security reasons.

> If you are root and there is a user speedy, what exectly does a

Ups? It should *not* succeed!

```
# id
uid=0(root) gid=1(daemon) groups=1(daemon),0(wheel)
# uname -a
SunOS nasim 4.1.1 6 sun3
# rlogin -l knarf localhost
Password:
```

How much are you asking - what would you take?

I was VERY lucky to sell my Falcon to a local music dealer (they sold them too) and I got $800+ for the same setup minus the VGA (I has an Atari RGB) and no defects or problems w/my system. I also tossed in the monitor adapters for both RGB and VGA displays. Also, my system was less than 6 months old and still under warranty.

Oh, I forgot to say that I only had an internal 85meg drive.

See if you can sell at a local music dealer first - they might give you less than you'd like for it but they will usually buy such a system because they can refurbish them for cheap and have a ready maudience for them.

In anycase, good luck! Buy a PC like me.. :)

If you don't want to spend too much $ try getting a Beatle Mouse. They can be bought at most Atari delaers for $30 and under (shop around). This mouse is comfortable to hold and has at least twice the tracking resolution of the stock Atari mouse. I've ushUWmsed mine for over two years w/no problems.

NOTE:kO Never buy an ALPHA-DATA mouse. The one I bought was a clone of the MicroSoft mouse. It was the biggest piece of shit I ever bought and died on me after only two months of use{

91. Atari Falcon SCSI connections

Newsgroup: comp.sys.atari.st
Date: 1994-07-02 18:07:12 UTC
From: michaelk@pacifier.rain.com
Message-ID: <CsBro1.xM@pacifier.rain.com>
Source record: 184340
Cross-posted to: comp.music,comp.sys.atari.st,comp.sys.atari.st.tech,rec.music.makers

My SCSI set-up is 4 meg Atari Falcon w/ 80 meg IDE, SCSI II port connected to an external 240mg HD . I recently bought a SyQuest Cartridge HD --- intenting to connect The SyQ to my external HD and then connect my SCSI sampler to the SyQ. My sampler is a Peavey SXII/SP combination which have 25 pin SCSI connections. My terminations need to include the Peavey SXII (permanently terminated) -- and going on the assumption that the Falcon is an end terminator, I set my SCSI ID according to the Falcon manual: external HD=0, SyQ=1 (skip 2)& sampler = 3. When I try to run the system I get id 0 to respond but id 1 produces the message "id 1 not responding" but id 3 will respond if I reverse the id's between the external HD and the SyQ, but still whatever I assign to id 2 I get no response. When I tried a straight sequence of id numbers (not skipping after the last hard drive) everything reads except whatever id 0 is! Also I estimate I have about 11 feet of SCSI cabling but people locally have told me that shouldn't make a difference. I have gotten these combinations to work : Falcon + 240mg HD + SyQ or SyQ + Peavey SP + Peavey SX but never the Falcon and Peavey together.

Questions:

**I've been told the Falcon and Peavey should work together --- can anyone confirm this ?

**I read an article recently which indicated that cable thickness could be a factor, the thicker ones providing less problems -- if this is so how does one tell which type one has ?

**I've read that SCSI II uses "active" termination while SCSI I uses passive termination and that there could be compatability problems. If this turns out to be my problem (assuming the SXII is passive) does any one know of a compatability fix ?

**Could there be problems simpling connecting a DB50 to a DB25 device?

Any comments are very much appreciated.....

michaelk

93. Hayes V Series Smartmodem 9600....*HELP!!*

Newsgroup: comp.sys.atari.st
Date: 1994-07-02 23:09:34 UTC
From: stevedc@ac.dal.ca
Message-ID: <1994Jul2.200934.25355@dal1>
Source record: 184343

I require a bit of information about a Hayes modem that I
just purchased. It's a Hayes V Series Smartmodem 9600. It
seems that whatever my compackage is set at, it will not
connect at 9600 noway no how. I have looked at the active
profile and want to also know what the command is to load
a stored profile 1 to the active. I have tried a few different
command that I have from another modem manual that I had kicking
around, but had no luck. Does anyone have that modem out there,
and if so could you shine some light on this problem for me?
I'd appreciate getting a capture of your stored profile
AT&V, if it's n0o trouble. Please E-mail me as soon as possible.

I'd also like to get the Address for Hayes if someone out there
knows it. I got the modem at a yard sale and there was no manual
included, just the adaptor and modem. Thanx in advance!

AM> anyway, so I don't worry about using my VGA occasionally.

Standard VGAs has an horisontal rate of 31,5 kHz.. Maybe some can manage 35,7 kHz (ST-High) but it will for sure shorten their lifetime.. All SVGAs that support 1024x768interlaced will do 35,7 kHz, so its no use to buy a SVGA that manage 1024x768ni (38,8 kHz) , it will be a waste of money (if you won't buy a Falcon)...
I've seen some companies selling such adaptors (here in Sweden) but it wont be _that_ hard to make it yourself.. Simply get a VGA pinout (just look in your monitors manual) and compare that to the ST pinout (in the back of the ST manual).. You will have to make some kinda switchbox if you wanna use it for ST low and medium (this _REQUIRES_ a multisync/scan that support 15,7 kHz).. Of course your SVGA will have to manage 71,25 Hz (for ST-high) and your multisync/scan 50/60 Hz (ST low and medium)...

Yes. In fact, warner owns 100% of the coin-op division, the Tramiels own 0% of it. This dual Atari confusion is part of the reason Warner merged it and Tengen into Warner Interactive (or whatever it's called)

Great Atari ST games & stuff for sale!

GAMES:
For $4.50/each game:
Arena, Deep Space, Barbarian, Obliterator, Terrorpods,
Mr. Heli, Forgotten Worlds.

For $12/game
Wrath of the Demon (enhanced colors for STE), Awesome,
Wanderer 3-D (3d glass included, a real virtual world!).

Compilations:
"World Beaters"--Outrun, Gauntlet II, 1943, Street Fighter-- $12
"Sega Master Mix"--Super Wonder Boy, Turbo Outrun,
Crack Down, ThunderBlade, Dynamite Dux---------- $12
"Triad II"--Menace, Tetris, Baal---------- $12
"Triad III"--Speedball, Blood Money, Rocket Ranger---------- $12

EMULATORS:
Spectre GCR (MacROMS included) v.3 ----------$160
(complete, box, manual, hardly used!)

FLOPPY DRIVE:
Future Systems' double density GTS-100 3.5" drive with LED
track indicator----------$70

MISCELLANEOUS ST STUFFS:

BACK-UP your copy protected games with:
TURBO BLITZ (software & cable)----------$10
SYNCHRO EXPRESS (software, parallel port cart & cable)-------$25

buyer pays shipping

Interested? please e-mail me! :)

OS/2 users expect better too; people who bought the new Word Perfect for
OS/2 were _returning_ it, that's how bad it was. It was faster to use
the incredibly buggy MS Word 6 via the Windoze support than to use the
native OS/2 WP6.

The spec says 7 feet, and unless you are using really good cable, 11 is
stretching your luck. Try less cabling to start with...

Also, what ID do you have the SP set to? it sounds awfully like it may
be on 3.

>**I've been told the Falcon and Peavey should work together --- can
>anyone confirm this ?

Yup. Done it. (Never had any software to test it with, waiting for
Notator Audio.)

>**I read an article recently which indicated that cable thickness
>could be a factor, the thicker ones providing less problems -- if
>this is so how does one tell which type one has ?

sigh Thickness has nothing to do with it, the impedance match does -
but how many magazine writers would be able to write about impedance
matching? *big*grumble*

As a rule, stay under 7 feet and all will be well. If you _have_ to
go over that, use cable specifically made for SCSI.

>**I've read that SCSI II uses "active" termination while SCSI I uses
>passive termination and that there could be compatability problems.
>If this turns out to be my problem (assuming the SXII is passive)
>does any one know of a compatability fix ?

Not really possible, and not really necessary either. Active termination
is usually required for FAST SCSI II, - bearing in mind that SCSI II isn't
a 'thing' in its own right, and mix'n'match I and II is fine.

>**Could there be problems simpling connecting a DB50 to a DB25 device?

Not really - as long as your cables are right.

>Any comments are very much appreciated.....

Get a copy of ICD's SCSI program - comes with the PRO utilities, and have
a poke at the SCSI bus with just the peavy units connected, find out what
their IDs are, and whether they respond at all.

This doesn't seem to be important for games consoles though. Case in
point, Nintendo dropped all NES support in favour of SuperNES; you
didn't see a huge consumer backlash, just people buying SuperNES.

Get a copy of the NVDI config CPX (or use the ACC that comes with NVDI) and
make sure you have everything turned "on". Be sure to save your settings.
You might also try changing the placement of NVDI in your auto folder. You
may have seen the NVDI numbers I posted in this thread. These were taken
on a 16mHz MegaSTE, so you should be getting something similar.

I have FAST.PRG (speed switcher), JAR10.PRG (configures the cookie jar,
comes with Neodesk), and PINHEAD.PRG load before NVDI.PRG.

106. 11 Bombs SCSI boot

Newsgroup: comp.sys.atari.st
Date: 1994-07-03 06:05:29 UTC
From: blai1690@mach1.wlu.ca
Message-ID: <CsCox5.M8C@mach1.wlu.ca>
Source record: 184253

Hello Folks!

I have somewhat of a problem: I installed a new SCSI Maxtor 345Mg
onto my Atari STe via a ADSCSI+; no problems up until I tried installing
icons for the new partitions. The software suggested up to drive M, but
that only came out to 344Mg, and so I tried adding an 'N' partition. The
TOS didn't accept it (partition does not exist, etc., yet I tried removing
the icon and TOS wouldn't let me either delete the drive by dragging it to
the trashbox *or* clicking on the drive & using the format command. So I
foolishly saved the desktop at this point, thinking that I could fix it
upon cold bootup. Now when I boot up, I get 11 bombs across the screen.
Unfortunately, I saved the desktop info to drive C, and am now seemingly
unable to change it. What can I do to change the bootup problem? I
assume that it my desktop info that is causing the problem, but I am not
entirely sure. If anyone has any hints, please mail me.

Thanks very much in advance!

Jeff

111. ICD Pro UTILS....

Newsgroup: comp.sys.atari.st
Date: 1994-07-03 09:32:38 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <2v60jm$kum@golem.wcc.govt.nz>
Source record: 184257
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well here is info about ICD's Pro utils..

NOTE: This could be out of date, ICD does not support there
customers on GEnie these days to well...

***** P R E S S R E L E A S E *****

Rockford, Illinois, June 23, 1993 -- ICD, Incorporated, a leading designer
and manufacturer of Atari hardware enhancements, today announced a new
standard for the Atari ST, TT, and Falcon computers.

ICD SCSI Pro Utilities(TM) was designed to provide all Atari owners a choice
of SCSI and IDE peripherals with the hard disk performance and dependability
that they can expect from ICD, the leader in Atari host adapters on the
Atari ST.

ICD SCSI Pro Utilities is a complete software tool kit designed for anyone
who owns a hard drive on an Atari computer. This unprotected package
consists of the ICD hard drive software that was previously available only
in a protected form, a new comprehensive version of Cleanup ST, as well as
other powerful new utilities. The software is supplied in a packed format
on two double-sided diskettes along with a 75 page manual.

The core of ICD SCSI Pro Utilities is the famous ICD Hard Drive Software.
ICDBOOT.PRG is a fully configurable, high performance hard disk driver.
It includes read and write-back caching with variable buffer and block sizes,
write-back delays, user selectable boot partitions, the ability to skip SCSI
IDs or partitions at boot time, smart removable media support, Floptical
support, along with many other useful options. By integrating the con-
figurable cache directly into the driver, ICD has enjoyed an amazing speed
advantage over other hard drive packages and add on cache programs.

HDUTIL is the utility program which allows the user to select the boot
partition, to zero or wipe a partition if desired, and to map out bad
sectors. HDUTIL is also the main configuration utility which easily and
logically allows the user to set the many options in ICDBOOT, the hard disk
driver.

ICDFMT is the preparation utility which is used to set up a new hard drive
or to change the existing partitions on a used hard drive. It also allows
the naming of partitions and editing of partition information. DESKTOP.PRG
allows the swapping of partitions with drive letters.

SCSI.PRG is an advanced command tester and sector editor for SCSI and IDE
devices. This powerful software offers the tools to troubleshoot SCSI and
IDE device problems, to read, edit, and write sectors directly to disk, and

to perform any other function using the SCSI command set. SCSI.PRG includes comprehensive on-line help and the option to save and load command strings for later use. The strength of this utility is that all operations are done directly to disk without the installed hard disk driver.

Cleanup, which was once sold as a separate program, will analyze a diskette, hard drive partition, or ramdisk, to determine if it has been damaged and if so how to correct it. Cleanup will detect and correct a wide variety of problems in the File Allocation Table (FAT) and in the directories. Cleanup will search a disk for bad sectors and optionally use multiple checks on each sector to find intermittently bad sectors. You simply can't buy a better safety net for your data than Cleanup. Using Cleanup is like wearing a seat belt. Once you start using it, you will feel unsafe without it.

ICD SCSI Pro Utilities also includes an ingenious CD-ROM driver for ICD Advantage/AdSCSI/Link SCSI host adapters and SCSI-2 CD-ROM drives. This driver is MinT/MultiTOS compatible, and a copy of MinT is included on the disk.

The suggested US retail price for ICD SCSI Pro Utilities is $49.95. It is available directly from ICD or from better Atari dealers everywhere.

For further information, contact ICD Press Relations in the United States by phone at (815) 968-2228 extension 222 or by fax at (815) 968-6888.

ICD SCSI Pro Utilities and The Link are trademarks of ICD, Incorporated. Other trademarks are those of their respective holders.

From the info that is in the ICD Pro , it looks like that CleanUp is no longer sold, its now part of the ICD Pro Utils...

I did ask them the other day and the same comment came back, buy the Pro Utils....

> into it... ick.

[Please, I don't want to start a flamewar over different machines, I'm just
trying to relay my impressions of the Risc PC.]

The Risc PC is definately worth looking at. I'm considering junking my
'87 ST for something with a bit more welly, but at the same time trying
to avoid PCs and Macs like the plague (No sir, I don't like 'em). I'd
dearly love to buy a Falcon, but I just don't see Atari supporting it at
the moment, and there seems little chance of future enhancements of the
hardware except for DIY kits.

There is an active group porting NetBSD to the Archimedes (my colleague
is at a meeting of the UK contributors this afternoon, in fact), but it
is still a fair way off. Many of the device drivers are yet to be written.

After going to a Risc PC demo on Wednesday, I think I'm sold. It really
is quite a phenomenal machine, even under RiscOS (the native OS). Get
someone to show you a good Replay file and compare it with a hot PC doing
MPEG decoding. The thought of being able to run UNIX on it aswell leads me
to think of it as near I can currently get to the perfect home computer.

> Does anyone have any SPECint '92/SPECfp '92 for the Acorn RiscPC?

Acorn doesn't subscribe to SPEC. I've heard that there are some unofficial
results, but I don't know what they are. If you want loads of fp power,
then you won't be too impressed with the ARM600. The ARM700 however, which
will be available as a simple plug-in card early next year should be
something to watch for.

> Linux for the PowerMac should prove interesting; I wonder how hellish
> it'd be to use X with a one-button mouse though...

Isn't this illegal in some states of the US? :-)

Rob

117. Status of the JANUS emualtor...

Newsgroup: comp.sys.atari.st
Date: 1994-07-03 16:17:23 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <ZE-SZiz.ari2550@delphi.com>
Source record: 184262

I recently sold my Falcon and bought a cheap, but usuable PC clone.
As my system is only a 386DX-40 (though still plenty fast under DOS), I
realize that the GEMulator ST emulator would be a waste of my time and money.

However, I remember hearing about the JANUS ST emulator hardware card for PCs.
As it is hardware based, it should run at normal (full) ST speed or better.

What I want to know is this:

Is it finally available? Is it available in the US? How much does it cost?
What are the performance specs? What are the exact system requirement?

I'd appreciate this info as I'm interested in selling my STe yet retaining
the massive collection of ST software I've amassed over the last 7 1/2 years.

Thanks,

Ari

: >available for such operations.
: There is absolutely NO support for PS or EPS import or export in
: Calamus SL. By paying extra for the Bridge Module ($150 in the US, don't
: know the UK price), you can get PS output. It still does not seem to get
: full PostScript support (eg still no support for Type 1 fonts).

Yes, but as we've said COUNTLESS times, working from our EXPERIENCE with the program, we do not NEED Postscript. Calamus is faster without it, and produces beautiful (if not superior) results. It also does not need Type 1 fonts because Calamus fonts are of top quality and they render FASTER.

IT DOES NOT RUN IN a AUTO FOLDER, its a TOS program....
---<

Come again!? Just rename virtually any TOS program to PRG and stick it
in the AUTO folder, and it'll work.... Very similar effect to running
it from GEM with the TOS extender, it just kicks out the GUI!

On a 1meg machine, you will most likely have to run it from floppy,
possibly by sticking all files except the executable into the root directory
and renaming the STARBALL.TOS file to STARBALL.PRG and sticking it in the
AUTO folder.

Then boot from a clean system. If it still gives problems, bypass the
music player routine (Hold down alternate or something - read the
imbedded doc's!!)

If this doesn't work - it's a problem with the program, or the ROM's!

Well, that's one way to do it. I happen to like GEM. I still remember the PC Guru who came over (he'd never seen GEM) and when I turned on my Falcon to do something, the first thing he said as I was using it was "I like this GUI a lot." He liked the way it looked and the way it worked. :)

~Chris

p.s. it was standard Falcon TOS 4.02 at 800 x 600

>

VEEEERY strange..! In my old, accelerated Mega 2 with TOS 1.4, NVDI 2.12 made a huge improvement.. Something from another planet compared to your results. For example, most text functions accelerated something between 2 and over 10 times - as did most other things, too.. In my current Falcon, NVDI 2.5 doesn't have quite the same effect - but it is very good, anyhow.

So, there's something very seriously wrong with something: your NVDI doesn't work at all, it seems (seen from those numbers..). You should see _at least_ a general acceleration of about 300%, if not much more.

For some comparison: I measured my NVDI with GemBench 3.4 while writing this with STalker (in multitasking, under Geneva..) ;-) ! So, it looks like this:

Falcon-030, 16 MHz, Blitter on, caches on
TOS 4.04 with Geneva, NVDI 2.50 and Speedo-GDOS 4.2 active
Multitasking with STalker active
Screen-mode: 800x608x16 (Blow-Up active)

GEM dialog box: 319%
VDI text: 708% (!)
VDI text effects: 501%
VDI small text: 426%
VDI graphics: 293%
...
VDI scroll: 196%
etc.

And generally:
Display: 282% (slowed down a lot by multitasking!)

Considering that NVDI doesn't speed things up in Falcon nearly as much as it does in ST (version 2.12 is faster, btw in ST than 2.50!) - those results speak for themselves, I think. Great program (and GemBench is great, as well =-) ! And Geneva is great, too - but there are some nasty bugs (especially the one preventing Falcon-owners from using TOS and TTP-programs... =-(Or maybe it doesn't happen in all Falcon TOS-versions, I don't know..

NVDI isn't very easy to install correctly. Especially, if it doesn't find its screen drivers (should be usually in the same folder as GDOS or Speedo drivers..), the new 2.50 version _does_ load - but doesn't do anything! The older versions cursed out loud in that same situation, not allowing one to start NVDI with false configuration. Is should, too, locate in AUTO folder before Speedo-GDOS or GDOS.

By the way: does anyone know what NVDIFIX program does - and how it should be used..? It should fix something in NVDI 2.50.

From: azog@world.std.com
Message-ID: <CsE862.HHG@world.std.com>
Source record: 184281

Ok, I finally got info regarding 2.5" and 3.5" IDE drives:

3.5": 40 pins, data
2.5": 40 pins, data; 4 pins, power

Now, I opened my Falcon in hopes of plugging in the Maxtor 7345 that I have laying about, but noticed a few things of interest.

First, I cannot simply plug in the cables, because the 2.5" uses a higher-density pin configuration than the 3.5" (ie: the pins are smaller and closer together). I just tried for the hellofit to plug them in, but they just dont fit. I will have to contact the cable makers that my company uses to see if I can get some sort of converter. They built me a special SCSI cable previously (using a 50-pin high-density D connector to a 50 pin flat berg connector), so hopefuly theyll be able to help me out.

Also, the existing 2.5" drive has what looks like 48 pins, as the last four on the connector are not being used, the cable simply leaves them open. Whats with these extras? They cant be the power pins, cause I am getting power to the drive!

The problem is this: The version uploaded was mistakenly the FPU only version! SO, it will only work if you have a TT or 68882 equipped Falcon. This has been posted before, I know, but we keep getting new problem messages... sigh.

Strange. I had no problems updating mine, so I guess if one finds a used
copy the latest version can be obtained with an update. Toad and other
mail order companies still advertise it. I got mine updated just a few weeks
ago, and it is version 5.08. This version requires 6.5.x of the ICD software
(it comes with icdboot.prg).

I'm pretty sure I put a file on atari.archive.umich.edu that contains
maps for every level in DM, plus a complete spell chart. If you can't find
it, let me know and I'll put it on.

In a message dated 7-3-94, Jeffrey Blair said:

"The software suggested up to drive M, but that only came
out to 344Mg, and so I tried adding an 'N' partition. The
TOS didn't accept it..."

First, you need to boot with the ICD software on floppy to access your hard drive's "C" partition and rewrite the info there. You can do this either by using a program that installs a "bypass hard drive" sector on the floppy, or by using ICD's hotkeys for skipping the hard drive boot. If the HD is external, you can also usually get away with turning on your HD after you have booted the ICD software from floppy.

That past, the ICD software has a limit of 12 partitions that it can handle on the desktop at one time. Therefore, it would seem "N" should have been allowed, so I am not certain what caused the problem in the first place, unless I can't count. <grin>

You could stop at "M" by either to use their desktop program to switch the remaining partition with another when you want to access it, or making one of the partitions larger, even if it requires going from a GEM to BGM partion in order to do so.

>native OS/2 WP6.
>

I find that Atari users tend to be more discriminating (as well as
really cheap, like myself :-) about software. OS/2 is nice, but]
like ALL PC stuff, MS and WP, Windows and OS/2 are HUGE and only
getting bigger. I dont know if this has anything to do with the
increasing bugginess of software, but I DO know that they are getting
more complicated and more complex.

Computers are no longer the hobbyists' toy, or even the term home
computer is no more applicable. I think the Minicomputer people have
taken over the microcomputer and are visiting their vengance upon it.
Not to slight anyone who uses bigger computers, heck I used to play
nursemaid to a PDP-11, but each time I put a PC computer together
I feel a little bit of me going away.

If only there was still a viable market for real Home computers,
stuff that a guy like me could afford, and ENJOY messing around with.

142. Re: help! Starball locks up

Newsgroup: comp.sys.atari.st
Date: 1994-07-04 08:30:13 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <2v8hal$vi@m1.cs.man.ac.uk>
Source record: 184155

On most machines Starball runs fine from Floppy, harddrive, AUTO folder, probably from Mars for all I know but on certain machines... 1040ST's with TOS 1.2 or 1.63, and Mega STe's, anything with TOS 2 it WON'T run from the harddrive, and on some it will only run from an AUTO folder. Exactly why this is I'm not sure yet, but you can bet your socks I'm looking for it.

Source record: 184295

hallvart@ifi.uio.no (Hallvard Tanger&#65533;s) writes:
>What is WINX 2.2 and GEMRAM for??

```
WINX is a large set of patches and fixes for the AES. It does things
like:
-Optimise redraws
-Allow window component colours to be changed on pre TOS 2 machines
-Allow real-time scrollbars on windows (ie like XControl sliders)
-Fix various bugs
-etc
-etc

GEMRAM loads the AES into RAM so that WINX can patch it.

WINX is extremely useful, it is a shame that it doesn't work with the
MTOS AES (which is in dire need of the redraw optimisation) even
though the MTOS AES is already RAM-based.

Yes, and on low resolution printers.

>...And what exactly to hints specify? Extra bezier curves?
>Individual points? Bitmaps?
For details you can consult the Adobe Type 1 reference (the black book). But,
simply, the hints say things like 'this is a vertical stem and so it this'.
The renderer uses this info to ensure that rounding does not make one stem
a pixel wider/narrower than the other. This can make a difference even at
300 dpi.

Perhaps there's more info in the comp.postscript faq?

Agreed. That's why I said some time ago that Calamus and PageStream can't
drive a 500c or 550c properly, and you claimed that output was good, then!
As I said before, I get *much* better output on the 550C using a GhostScript
driver which does colour Floyd-Steinberg dithering. If Calamus could give
me that without going via PostScript, I would be glad to ditch PageStream.
I have not had much success trying to improve the default line screen for
Calamus to the 550C.

152. Help! Hard Drive Problems

Newsgroup: comp.sys.atari.st
Date: 1994-07-04 11:10:34 UTC
From: Mojo <mo@sna.co.umist.ac.uk>
Message-ID: <1994Jul4.111034.23480@nessie.mcc.ac.uk>
Source record: 184156

My system refuses to talk to my hard drive anymore! What happens is that when the hard drive is connected, my ST boots up but flashes the floppy drive light once (instead of the usual two times) and ends up at the desktop without any desktop icons (both drives and wastebasket). If I disconnect the hard drive from the ST, the system boots off the floppy just fine.

Have anyone got any theories? Reply by e-mail please. Thanks in advance.

Jakes Mo, mo@sna.co.umist.ac.uk

155. More game software for Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1994-07-04 13:15:21 UTC
From: trek@intgp4.ih.att.com
Message-ID: <CsF3HM.4yy@nntpa.cb.att.com>
Source record: 184157

Hi all. I have now tried SimEarth, SimAnt, and SimLife and the mono versions all work on Spectre GCR under System 6.0.5. Great fun. Wayne

JL>
JL> I used to have a list of some of the spells that were possible
JL> within Dungeon Master (the original). Since I seem to have lost this
JL> list in floppydisk limbo, can anyone send me a copy, or better yet,
JL> post here with such spells or other hints. Thanks a lot.

Dungeon Master Spells
Spell name Symbols Produces Purpose
FUL X4 Light Magic torch
VI X2 Vi potion Give health, cure injuries
MON X1 Mon potion Give stamina
YA BRO X15 Ya potion Magic shield
VI BRO X25 Antiven potion Cure poison
ZO VEN X61 Ven potion Poisonous potion
OH VEN X31 Poison cloud
ZO X6 Open some doors
YA IR X14 Magic shield
DES EW X52 Kill spirits
FUL IR X44 Fireball
FUL BRO NETA X454 Fireshield
OH IR RA X345 Light
DES IR SAR X546 Darkness
YA BRO ROS X152 Magic footprints
FUL BRO KU X451 Ku potion Give strength
OH BRO ROS X352 Ros potion Give dexterity
YA BRO DANE X153 Dane potion Give wisdom
YA BRO NETA X154 Neta potion Give vitality
ZO BRO RA X655 Mana potion Increase mana
OH KATH RA X335 Lightning bolt
OH EW RA X325 See through walls
ZO KATH RA X635 Zokathra spell
OH EW SAR X326 Invisibility
DES VEN X51 Magic missile

X is any of the first six power symbols. The higher symbol you pick, the more powerful spell will be cast. You'll need more mana though.

There are some other hint files and maps on atari.archive.umich.edu in the /atari/Games directory.

Yes, you may download it from:

micros.hensa.ac.uk

under

micros/atari/tos/n/n128/*.*

GEMRAM 1.6 is also available from here, under

micros/atari/tos/n/n127/*.*

Download and enjoy.

160. ZFC's Experimental WWW (Mosaic) based Atari Directory

Newsgroup: comp.sys.atari.st
Date: 1994-07-04 14:22:00 UTC
From: A.V.Groenink@zfc.nl
Message-ID: <CsF6Ko.1D0@inter.NL.net>
Source record: 184161

I am setting up an experimental WWW server for ZFC (think of e.g. the Edith Professional software), and would like to include an Atari Directory which covers as much of what's available on the internet as possible. Currently the pages include general information about and links to news groups, ftp sites and FAQs. We would also like to include a directory of interesting Atari addresses worldwide.

Hopefully, within one or two weeks, the site will be up and running. I will soon publish the address, so people can have a look at it and give their comments.

Any suggestions and contributions are welcome. Please write e-mail to us at

A.V.Groenink@zfc.nl

If the space on my local disk at CWI allows it, I will also build an archive for the newsgroups comp.sources.atari.st and comp.binaries.atari.st with all issues starting January 1994.

We plan on an experimental phase of 1/2 year. If there is sufficient interest, and business perspectives are promising, we will give the service an official status.

thank you,

Erm, ESS-Code v6.1 does mime encoding/decoding.

You can download it from:
micros.hensa.ac.uk

under
micros/atari/tos/n/n172/

Oh, and if you live in the UK, then I do UK support too....ESS-Code is
now Shareware.

163. Re: Why GOAL! is the best football game ever

Newsgroup: comp.sys.atari.st
Date: 1994-07-04 14:44:35 UTC
From: sjdrew@cen.ex.ac.uk
Message-ID: <CsF7MC.6Gw@cen.ex.ac.uk>
Source record: 184163

I've now had a whole weekend to get to grips with Goal!, and
I've got to say this is an amazing piece of software.

I thought Kick Off was great (I bought my ST after seeing it!),
and have followed the series from KO Extra Time through to
Final Whistle. Goal! makes them look ordinary by comparison.
What most impresses me is the way that playing Goal! is much
more like actual football than anything I've seen. The
intelligence and movement of the computer controlled players
makes for a real challenge, and one that I haven't got close
to mastering yet.

It's a shame that this game got such a bad press from the
Atari press. I hope that they re-evaluate it because
there is little enough quality software about, and what
there is deserves their support or else little will become
nothing. I've been waiting for Player Manager 2 for years,
and it looks like I'll have to have another machine to run
it on unfortunately.

Still, there's years of playing time in Goal!

164. Help needed with Supradrive 20

Newsgroup: comp.sys.atari.st
Date: 1994-07-04 14:59:53 UTC
From: vicb@clark.edu
Message-ID: <2v9859$8li@clark.edu>
Source record: 184165

I'm at my wit's end, here, and I'm in dire need of assistance.

I bought a Supradrive 20; it doesn't have a clock, so I'd guess it's one of the older ones (didn't the later ones have a clock?) It has a Miniscribe controller. The SUPFMT and SUPUTL programs both have version numbers of between 2 and 3, and are listed as being copyright 1987.

I can't get consistent performance out of it. It takes me several tries to format it with no bad sectors. Then, within a day or two, it starts acting flaky, with semi-frequent, "Data on disk in drive C:/D:/E: may be damaged, messages. At first retrying will allow the operation (usually a writing operation) to succeed, but eventually they just end up failing. Then, after all of this, if I do a mapping, much of the time I'm told that the partition is un-useable due to bad FAT sectors.

Is there anything I can do about this? Is there some software that will give me a more reliable format operation? What would it take to replace the drive mechanism? Would leaving it on all the time, regardless of the computer being on or off, help?

This is my first hard drive, so it's safe to say that I'm pretty new to this.

Help!!!

Victor Bruhn
vicb@clark.edu

In the above statement you are refering to the MAGE (Majic Arcade Graphics Engine). This is not a game authoring system per se, instead it is a set of routines that will allow you create virtually any type of game or educational application. Unlike TADS or STAC, it has no text parser support, but it does have everything you need to do animation, sound fx, scrolling, and map-room plotting at 20 frames per sec on any Atari model.

I know this because I worked on this package. My sprite artwork is included in the package. The MAGE has been available for over seven months now - but so far only here in the US. The publisher was unable or unwilling to release it in Europe.

BTW, it is still quite available and for cheap. However, be aware that it uses GFA-Basic 3.5 as its support language (included in the package too) and that there are no documented hooks for using it w/other languages.

This system is powerful but not very easy to use for the novice. You must program to use this system.

Berserk, Insectroid (March 93 ST-Format Cover disk), Cudlee's Quest, Kid-Kong, Dark Pearl, Kid-GP, Frogger, ST-Review Invaders, and Megapede were all written with this system.

If you need more info feel free to e-mail me. I own the system but no longer use it myself since I've upgraded to a PC...

Regards, Ari

Well, actually there is! Buy an "older" PC like a 386DX or 486SX... :)
These systems are rapidly becoming so inexpensive that they can be gotten
for alittle more than a complete STe system.

These machines still have plenty of zip as long as you stay clear of Windoze
and there's enough software for virtually any interest.

Back in the days when I bought my first ST (1986), there was a differentiated
market for micros. Now there isn't except in regards to price.

Try STORM (patched to v1.02) and Uniterm. Both can be found on any Atari FTP site or on-line service. STORM is very slick and supports newer Atari hardware very well but is alittle lacking in protocols.

Uniterm is old but has many features and supports KERMIT which is essential if you want to transfer things to and from a mainframe.

Both have very good VT-100 support as well.

169. RSVE German/English docs on a.a.u.e

Newsgroup: comp.sys.atari.st
Date: 1994-07-04 17:43:12 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2v9hng$6h0@mailer.fsu.edu>
Source record: 184170
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just received a version of the RSVE instructions in both German and English from Harun Scheutzow (the author of RSVE and HSMODA0x). It is on atari.archive.umich.edu in /Utilities/Tosfixes/rsve_ge.lzh.

RSVE is a small board that can be connected to any ST (4 wires) that will allow one to use the ST/STE serial port (Modem1 on MSTE and TT) at much higher baud rates that before without data loss. The instructions include GAL programming information, negatives for board traces, etc. The fastest one can safely push the standard ST/STE serial port is 19200, which does not take full advantage of today's high speed modems. With RSVE, 38400, 57600, and 115200 datarates are possible. Several terminal programs (most notably CoNnect) directly support the RSVE extension. Other programs can use these higher datarates via the HSMODA0x serial port drivers.

Harun also offers prebuilt boards (very small, 33mm X 33mm), for those that do not have the ability to make their own. His contact information is also included in the file.

I would add CoNnect to this list. It excels in every area except screen speed (relative to the packages above). If you have a fast machine (MegaSTE, TT, Falcon, accelerated ST) it stands head and shoulders above the rest IMHO. It is definitely worth a look in any case. It is shareware, on atari.archive.umich.edu.

Regardless of what program you use, be sure to get the HSMODA04 serial port drivers. They fix the RTS/CTS bugs in TOS, and do other nice things.

Oh, in my tests Uniterm was the fastest term program (with decent vt100) for a stock 8mHz ST. It is a great one, and I used it for many years. On my 16mHz MegaSTE with NVDI, CoNnect is quite fast (and the extra features and nice user interface are worth more than getting a bit more screen speed from Uniterm, to me at least). NVDI or Warp9 is highly recommended in any case.

> Uniterm is old but has many features and supports KERMIT which is essential
> if you want to transfer things to and from a mainframe.

Uniterm does not come with Zmodem capability, which is highly desired for fast modem usage. However, one can retrofit it by using a few macros and an external Zmodem implementation (like GRZSZ 2.28, also on atari.archive).

I'll take this opportunity to offer my mono SimAnt for sale. I'll take
$10 for it, I'll pay shipping within the continental US, buyer pays shipping
otherwise. Original disk only, but I believe there is extensive online
documentation (I'll check before making the sale). I had no problems playing
it on my Spectre. This is a Mac formatted disk, but I can transfer it to a
Spectre formatted one if the buyer needs it (and will thus sell the original
disk, and throw in the Spectre formatted one with no additional charge).

Anyone interested please email me directly. Oh, SimAnt is a simulation of
an "ant attack" of a human dwelling. Action is first centered on the
back yard of some poor boob. After the yard is conquered, one can attack
the house. It is a very detailed (if a bit whimsical) simulation, by the
same folks that did SimCity et al.

Like it says, really; does anyone have any thoughts about these two packages. I'm looking for an upgrade to Protext 4.3, largely 'cos I'm bored of its inability to co-exist with any DAs or AUTO folder progs I run. I need a text cruncher rather than a layup package (I'm also running Calamus 1.09n) and will be using it for writing up a thesis. All contributions will be received with gratitude (it might help save me mis-spending UKP100+!)

Cheers
Jon - spbcajk@ucl.ac.uk

I can add that while using Redacteur 4(I used to have 3 also), I have not
had any problems with DA's or AUTO folder PRG's. I am not sure what the
difference is between Redactuer 1 and 3 is, but Redacteur 3 worked for me.
Redacteur 4 adds a term prg, database, spreadsheet, and drawing program,
and is also only available in french:(I happen to know french, so that
is no big deal(Hey M. Jean-Etienne).

The program is lightning fast, and will do the job. One drawback, and
they probably won't fix it, is the incompatability with Geneva(personnal
experience), and MultiTOS(from what I've heard). I have no idea about
'MAGIX!'.

This is what I know,

Joseph

175. ST Games For Sale **

Newsgroup: comp.sys.atari.st
Date: 1994-07-04 18:52:40 UTC
From: MPARKHUR@UCSVAX.UCS.UMASS.EDU
Message-ID: <2v9lpo$o59@nic.umass.edu>

For Sale ST versions of the following games:

Campaign $15
War in Middle Earth 10
Midwinter 7
Pro Tennis Tour 7
Colonel's Bequest 7
Test Drive 7

No boxes, but I believe I have the docs for all these.

I may be willing to haggle a little; make me an offer if you don't like the posted price.

e-mail me: parkhurst@polsci.umass.edu

In a previous article, wells_s@ix.wcc.govt.nz (Steve Wells) says:
>
>Stardust?

You _have_ heard of Stardust on the Amiga, haven't you?
>
>If Utopos II is commercial, I'm not paying more money for it!

According to what I've heard, Utopos II is going to be almost a completely
different game. I think it's got missions and stuff like that, and I think
it's sounds pretty cool, and definately worth being a commercial game.
Version 1.7 is still shareware though, and you can get it sometime for the
Falcon and the STe. It's not ready yet, but Aggression is working on it I
think. Try writing email to Creator of Aggression for more info:
janip@freenet.hut.fi that is, if he's still got his modem :)

For VT-100 and VT-102 support geared for UNIX, the one of the best terminal programs is ANSITerm. It handles stuff coming from UNIX virtually flawlessly, and it also does 16 color ANSI graphics without any annoying flicker, although it does it by using 4x8 characters (surprisingly easy to read) in ST Low.

ANSITerm 1.91, is also, by FAR, the fastest terminal program available. On a Falcon it keeps up with full tilt 57600 bps without hardly getting behind at all.

Are you really sure about that? My DJ500 prints 600x300 on internal
(and soft)fonts, but is restricted to 300x300 on any graphics. I
thought the major advantage of a 520 was that it can now print
graphics in 600x300 (at last!)

>
> I gave up long ago on getting answers from them...

I'm sorry you've had such bad experiences, but I feel compelled to point out that in the 8 years I've been dealing with ICD (on host adapters, accelerators, tape backups, and much software) I've never had the problems you have mentioned. I've had good support from the customer relations people, all the way through to tech support. In fact, they've bent over backwards on a couple occasions to help me out, when the problem wasn't even their fault.

I hate to see what I consider to be one of the "good guys" in the Atari developer community get slammed on the net. If folks keep abusing the few developers we still have left on the platform, eventually we won't have any.

I think it's especially smarmy the kind of crap I seem to be seeing more and more of on the net these days, which goes: "I haven't heard anything from XYZ Company for a while now, so did they go out of business or what?" People skim past that kind of stuff, then pass it on to friends, and pretty soon you've got lots of people going... "Oh, yeah, I heard they went out of business." This definitely isn't the kind of thing that's helpful to anybody. Either the companies themselves, or the customers they have out there who rely on them, and would like to continue to be able to do so.

>
>Or, does any one here know of another monitor that will work with the TT?

I am using a Moniterm Viking 1 monitor and it's just working fine, it's a
21" screen with very good sharpness (focus) I made the cable myself and
also did a little bit of modification (screen width and vertical hold had
to be adjusted) the monitor was a left-over.. (the factory upgraded to
color systems)

Maybe you can get hold of one.

One minus point: The monitor produces quite a lot of interference on my
TV... Especially the desktop (on/off/on/off lots of square waves :-)

Yep, even the Sega Megadrive doesn't have any ROM based software inside.
The 68000 processor is started from reset with code fed in from the
cartridge and the onboard z80 is kicked into action by setting a bit..
Maybe with the add-on CD system there is sone software inside (must be,
for reading in the CD boot data..)

I wonder what happened to the version of Pinball Fantasy that was coded for
the Falcon... I guess Digital Designs thought it was too costly to market
it... Hmm thing is, why didn't they release it as shareware? (They had already
coded it!) Could have made _some_ return on investment...

If you want to test out how good your comm program does vt100 emulation,
then I suggest trying out the vt100 animations at the following
URL:

gopher://calypso.oit.unc.edu/11/../.pub/multimedia/animation/vt100-animation

The file "torturetest.vt" is the best for testing out the vt100
capabilities.

Uniterm does quite well. Stalker lacks the double height/width
capabilities. I haven't tried other comm programs since I do
not have them.

Isn't this fascinating, I myself looked over an article in a Dutch magazine (Computer!Totaal) last week about this RISC-PC and I think I'm hooked already... Bought a few magazines today (Acorn user & Acorn computing) and found out that there are already more CD-ROM titles for the RISC machines than for Atari :-) I once had a Acorn Atom which was upgraded with BBC Basic, I really liked that machine, easy to program and although I couldn't 'swap' with other computer users it didn't bother me then. I feel with Atari like on a dead-end street. The hardware upgrades are very expensive and hardly up to date (graphics cards, networking etc) The multitasking capabilities are just so-so.

The fact that a 486 processor can be fit inside this RISC PCwill help with the everlasting remarks of 'you can't run this super MS-DOS blabla program on your machine can you ?', or 'look at my super GIF slide show program'

>There is an active group porting NetBSD to the Archimedes (my colleague
>is at a meeting of the UK contributors this afternoon, in fact), but it
>is still a fair way off. Many of the device drivers are yet to be written.

Do you know if there is a Novell link possible between the RISC-PC and a Novell server ? I read already about Ethernet cards for the RISC-PC and about Acorn network software.

>After going to a Risc PC demo on Wednesday, I think I'm sold. It really

Considering the price it almost is. Still couldn't work out if the machine has standard SCSI ports (internal or external) or IDE only or do you have to fit in a SCSI card. I do want to use my SCSI HD, CD-ROM and Tapestreamer of course. What kind of monitor connector does it have (VGA D15 ?)

Papyrus Gold is fantastic - easily one of the best serious software ever
created for Atari computers.. It, however, does have its limitations:

1) It needs a fast machine (Mega-STE/Falcon is a minimum, when using Speedo
fonts, I think)
2) ...???...

Well, that's about it. No further complaints! Great to use, reliable, lots of
useful features, innovative, multitasking-capable (demo has some problems with
Geneva, however..), supports color, Speedo, clipboard, NVDI, etc.
It has many Desktop Publishing-features, too - and they really work.

I haven't tried Redacteur - but I think it's a lot faster - but much less
capable of DTP-oriented word processing.

Tommi

I work for The Quaker Oats Company. Dan Dorfman said that we were going to be taken over by Nestle. There was a great deal of excitement, but it didn't happen. Until I see Jaguars in discount catalogs, I'll presume they're selling exactly as fast as IBM can manufacture them.

I build PC systems for people who want them, I do about 4 systems
a week. I have had everything from a '286-8 to a '486DX4 PCI system
in here, anything other than a Mac or and Atari is NOT a home computer.

I used to sell Atari systems... or point them to Atari dealers, I
managed to get about twelve people to buy MegaSTe's back when they
were still made. Unfortunately, no-one can afford to make home computers
anymore... even Mac is having big trouble now.

Sorry, what I meant was that INTERNAL fonts means the built-in
fonts PLUS any font cartridge fonts or soft-loaded printer fonts.

I was just trying to emphasize that most word processors and DTP
programs are not the same kind of fonts and are treated the same
as graphics, which would only be limited to 300x300dpi.

Source record: 184199

In a message dated 7-4-94, Billy D'Augustine said:

"First, I cannot simply plug in the cables, because the 2.5"
uses a higher-density pin configuration than the 3.5" (ie:
the pins are smaller and closer together)."

There are some companies that sell these ready-made for the use on
the Amiga 1200. As I recall, Micro R&D sells a small PCB board called
IDE 2-to-3 that plugs into the the 44-pin interface, and provides
a standard 40-pin interface (meaning you would need to provide
external power to your drive). Dataflyer sells their XDS system, (about
$79) which includes an external case for a 3.5" drive, and the necessary
44-pin to 40-pin cable, and I believe it splits a power feed off of the
44-pin interface.

Redmond Cable may also stock IDE 44-pin to 40-pin cables.

As to the extra four pins on the drive interface, I suspect those
are jumpers. One should be for setting the drive as slave or master
(as the IDE standard supports two drives, regardless of size factor).
However, your guess is as good as mine as to what the other is used
for. <grin>

] Well, actually there is! Buy an "older" PC like a 386DX or 486SX... :)
] These systems are rapidly becoming so inexpensive that they can be gotten
] for alittle more than a complete STe system.

My 1040STE (1meg) cost me ~$200US _Brand_New_ almost a year ago, and a monitor is about, say, $400 (I'll say it's a good one! :). So, for a basic system, with a 2400 modem, cheapish printer etc., It'd be about $1000. I've yet to see a decent 386DX for less than about $1200 - and that's just the computer & monitor. (Of course, I'm not taking the hard-drive into account, which is ususally about 200Meg these days. Not needed on an STE, compulsory on a IBM-Clone!)

The companies producing for the ST's have killed it more than Atari or it's users.... As has been said lately, ST owners are somewhat more discerning in what software they want than their PC counterparts! :)

I would like to know what a _decent_ Kermit transfer is. I was stuck
using Kermit this past school year, and I really did not get much better
transfer speeds on my 14400 modem, vs my 2400 baud. I really don't
understand Kermit, and what parameters one must change. The system seem
to have an upper limit on speeds, even when I was connected to the high
speed modem(9600 baud).

Any hints would be helpful,

Thanks,

Joseph

>What is the best comms program to use on the Atari for Internet?

I've been trying out both Storm 1.02 and Connect 2.46. Storm is by Alan Page, author of Flash 1.x, and Connect is a German program, one of the most powerful and professional programs I've seen on the Atari. Both are shareware. For features and shear telecomm power, Connect is a clear winner, however, Storm is extremely easy to use, and has multiple windows, including one for the capture buffer. The capture buffer is limited (AFAIK) only by the amount of available memory. I find this capture buffer very nice to work with, especially when I want to cut something from it and transmit it back out the terminal, or save a portion of the capture to disk. My recommendation for Internet is Storm, but I suggest you check out both programs; you will like them both. They're available via FTP from most archive sites (like umich).

i agree, papyrus Gold IS fantastic, sometimes (by table operations) it's very slow,
but still great. it's realy easy to use.
the actual version doesn't have a spelling checker, the next version (3.5) i havn't got it
yet, has one included.
a big PLUS is, the authors are reachable on Internet!

i used redacteur once for testing, what i liked most was the grammar(!) and spelling
checker. my french isn't very good, so the grammer checker was helpful for me, to look up
verbs,...

but for me, the better choice is Papyrus...

216. WW2 forgot how to spell

I like to use Word Writer 2 (UK) for e-mail messages because of its speed and, more importantly, its spelling checker. I received it an a cover disk of a British mag. and have suddenly had problems. Any function that uses the spelling checker results in several bombs, too many to count before returning to the desktop.

I checked all the Paths including the dictionary, removed all AUTO folder files, reinstalled the program from floppy, and even tried to use BACKWARD. The View Thesaurus command still works but not the spell checker. The only thing that changed that I can recall is a 14M ram upgrade, it worked fine with 4M. System: Falcon 14M, TOS 4.04

Any guesses?

When I wanted to upgrade from protext I looked around at what was available.
Papyrus wasn't around at that time though.

I checked out the redacteur demo and it was very nice indeed. The only problem
is that it does not have an English Thesaurus.

I decided to upgrade protext 4 to protext 6. A fast GEM based WP would have
been splendid but I didn't find one to match protext's power.

222. Re: RSVE German/English docs on a.a.u.e

Newsgroup: comp.sys.atari.st
Date: 1994-07-05 10:11:01 UTC
From: s002893@YPSERV.rz.fhtw-berlin.de
Message-ID: <2vbbjl$ibs@RW320B49.rz.fhtw-berlin.de>
Source record: 184226
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Oh, Mickey, You make the RSVE better than it is. Do not wake up expectations it can not satisfy!

I will explain it: It is impossible to switch die MFP (which handles MODEM1) to a higher rate then 19200 only by software - if you like to use the asynchronous mode! You NEED this mode (more technical: the /16 divider) to synchronize on the async data your computer receives.
If you switch off the /16, you may transmit at more than 19200 error free, but the receiver makes mistakes, more or less, earlier or later. There are some ugly accessories and programs doing so.

RSVE generates higher clock frequencies and lets the /16 switched on.
The problem of synchronizing the data remains solved.

The next problem are uncooperative programs (as the Atari operating system, the TOS, really!) which disable the interrupts too long. (In some situations it is necessary to disable the ints, but keep such passages as short as possible!)

On an 8MHz-68000 ST with TOS2.06 and my drivers (with the FASTINT-option on, which "patches" a bit the most uncooperative part of the TOS) you can receive 57600Bd without any errors, as long as no hard disk access or keypress or mousemove occurs. Under Magic you can work (nearly) without restrictions while receiving at 38400Bd.

115200Bd error free is only possible on TTs or with a good CPU-speeder and a bit luck (the critical routines remain in cache or lay in the fast RAM).

There is a way to break the 57600Bd border on 8MHz machines too, but this is a bit more expensive than this RSVE.

Greetings, HS

Have you considered That's Write? It's very fast, handles big documents well
and has powerful style control as well as a built in programmin language for
macro writing. It has a spell checker which is a bit naff but is otherwise
fine. It has a utility with it to take Calamus fonts and convert them to it's
own native bitmap format. For details contact compo@cix.compulink.co.uk

>julian@loose.apana.org.au

Well from the most people that I know use FDT, are teenagers, I have never rated it al all, no great Zmodem support no VT100...

There will never be any more support for it, the Author lost all the code in a hard disk crash, there has been a lot of talk that he intends to upgrade it, but after 2 years its all just all talk....

What we still need is a good Terminal program, I was hoping THE STORM would be it, but that is no longer supported, and still has a few bugs...

Plus I think have used most of them, well allmost....

To get your system to boot up hold the control key (or is it alternate) while booting. This will present you with the basic desktop with only the floppies and C drive icons. Manually edit you desktop.inf file, or change its name and reboot. You should have your system back.

I have a Quantum 425 meg drive formatted into 5 partitions on my TT using ICDs software.

It's definitely the HD driver. It might help if I remembered to check which
drivers I'm using at the moment! It's a fairly recent version of AHDI, anyway.

>

Actually, other than the HD driver, I don't think there's much that does cause
problems. I can quite happily run Starball with Quick ST 3 installed, as long
as I run from floppy, and generally if QST3 doesn't crash it, not much will!

233. [Announce] Stello v 1.1 updatet othello game

Newsgroup: comp.sys.atari.st
Date: 1994-07-05 14:44:25 UTC
From: atari@monet.name
Message-ID: <1994Jul5.144425.26824@imada.ou.dk>
Source record: 184236

Hello everybody.

After five years of development, here it is. The ultimate
Othello/Reversi playing program "Stello". Outstanding features
such as

- Works under Gem, all Atari computers, all screen resolutions,
(x resolution must be at least 640)
- Supports Multitos and WINX
- Uses multitasking under Multitos
- Advanced gameplaying algoritms, alfa-beta minimax, iterative
deepening, response killer table, saves game tree and
uses the zerowidth minimax modifikation.
- One of the best Othello programs in the world.
- Background pictures on the board
- Supports english, german and danish (Hey i live in Denmark).

New in version 1.1

- Dialogs in windows
- Nicer interface (3d buttons and checkboxes even under old
tosversions, niceline menus)
- A few bugfixes

More details in the documentation. Stello is a Shareware game. I
have uploaded the game to the following ftp sites, in the file
STELLO11.LZH, it should be free for download in a few days.

ftp.uni-paderborn.de
ftp.uni-kl.de
ftp.cnam.fr

Happy Othello playing.
Claus J. Pedersen.

234. Karate Kid II

Newsgroup: comp.sys.atari.st
Date: 1994-07-05 14:54:14 UTC
From: klassa@aur.alcatel.com
Message-ID: <2vbs6m$f5p@aurns1.aur.alcatel.com>
Source record: 184235

Anybody remember the game Karate Kid II (came out about seven years ago maybe)? I could never figure out how to get past the final (?) round -- the one where you're on something that looks like a mat, after the bonus round where you try to break ice sheets. On the ice-sheet round, it seems like you had to move the joystick in a clockwise motion, as fast as possible, to get the little drum thing to spin (I never did figure out how to break any ice sheets, though). In the final round, after you beat up your opponent, you'd wind up in the middle of the mat, face-to-face. The little drum thing would start to spin (which you could speed up with the clockwise joystick motion), then the bad guy'd punch you in the face & you'd die. I could *never* get past that...

Did anybody ever play that game successfully? I'd love to know what I was doing wrong...

Thanks-
John

> But it's quite cheap compared to the price of an Apple developper registration -
> I'm not an Apple dev ! -

Unfortunately, you certainly get what you pay for. I have not received a single shred of developer information from Atari for nearly a year now. We used to get a bi-monthly newsletter called 'Atari.RSC' but even that's gone now. As it is, the best source of developer information comes from other developers and software publishers, which is why organizations like the IAAD are so valuable (as well as information exchange forums like comp.sys.atari.st). And as far as developer documentation is concerned, buy The Atari Compendium book and you will have more usable info and in a readable form for much less $$$.

I have not paid my Apple Associates developer fees yet as there is so much stuff available to the general public at such low cost. For example, I subscribe to an Apple developer's magazine called 'Develop' (appropriately enough) which is published 4 times a year and each issue comes with a CD-ROM filled with info such as new System changes, documentation, utilities, sample code, etc. And the cost? ... just $30 per year.

I'm not saying that Atari needs to go to these extremes, but developer support is essenitally NON-EXISTENT from them now (which gives you a fairly accurate indication of how serious they are about the future desktop computer market).

Just my $.02.

I use Connect which is fine if you have the memory and screen rez to let it shine. If you're short in those areas, try Uniterm. Both offer true VT100 emulation, something that FZDT is lacking.

I'm curious to know if anyone has gotten the ISO 8859-1 (Latin-1) character set to work with Connect, and also the "meta" key needed for emacs. I can't seem to get these working, but then I haven't tried all options yet. Do I have to select VT220 emulation for this to work?

Starball locks up on my machine unless I hold down 'alt' as it loads.
(It locks up just after the bit that prints `Starball 1.10 loading').
This happens if I run from HD, or even if I do a totally clean load from a
floppy.
My setup is a Tos 1.62 STe with 4Mb. Curiously, a friend of mine doesn't have
this problem, and he has an identical setup, except that it has only 2Mb.
Could this be another case of the 'Four Megs Bad' problem that seem to hit
lots of games? (e.g. Railroad Tycoon, Civilization)

Ok, I've been asked by several people to repost this because some people missed it over the long weekend holiday. So instead of just posting the same thing, I changed the first half somewhat. People from outside the U.S. can participate in this campaign by writing these companies in their country. Thanks!

CAIN's A.C.T. Now (Atari Community Together Now)
Jaguar Writing Campaign

Contact: Len Stys (aa399@cleveland.freenet.edu)
A.C.T. Now Organizer
CAIN Assistant Newsletter Editor
Cleveland Free-Net Atari SIG Manager

The 64-Bit Jaguar is Atari Corp.'s only hope of staying in business. This is fact. If the Jaguar fails: say goodbye to any more new games for the Atari Lynx, say goodbye to any thought of a new line of Atari computers being released, and say goodbye to any thought of new software being released for the Atari ST/TT/Falcon030 line of computers. If you are a member of the Atari Community, you should be pulling for the Jaguar to be a success.

This is the situation. The people at Atari Corp. are doing everything that they can to make sure the Jaguar is a success. But because the Jaguar is a new product and it is competing against systems like 3DO, SNES, Genesis, and future systems like Saturn and the Nintendo 64-bit, big name companies are wary about investing in the Jaguar. They are also not sure if there is a demand for their games on the Jaguar.

Yes, Atari Corp. has 150+ companies developing for the Jaguar, but most of these companies are one or two man operations. And a lot of these people are writing games for the Jaguar as an extra to their full-time job. It could very well take these small companies a year or more just to finish one game. There is also no guarantee that these companies will even release the game they are working on and if they do release it, the game may not be that great.

We are at the point where Atari Corp. is waiting for big name companies to decide to develop for the Jaguar. At the same time, these companies are waiting to see a demand for their games on the Jaguar. So when will these companies realize that there is a demand for their games on the Jaguar? One of two things must happen. Atari Corp. must sell 1 million or more Jaguar units before these companies will start making their games for the Jaguar. Since Atari Corp. will not be able to sell 1 million Jaguars without these companies selling their games for the Jaguar, the second

thing must happen. This is for companies to receive hundreds of letters from Jaguar owners that want their games for the Jaguar.

If these big name companies are not convinced to make their games for the Jaguar in the next few months, they will sign to develop for Sega's Saturn or Nintendo's new 64-bit. If this happens, Atari Corp. will be locked out once again from game companies. This happened when Atari attempted to get companies to make games for its 7800 game system. Nintendo already signed companies to make games for its NES.

As you see, there is no other choice. The Atari Community will need to start writing letters to these game companies or we will witness Atari Corp. following Commodore International.

Will writing letters work? Yes, they will work. I have a degree in Business (Management & Marketing) and through my past business experience, I've learned that letters do make a difference. There are many ways of determining a demand for a product, but nothing is more convincing to a company than hundreds of letters from consumers that are asking for their product. Letters are concrete proof that demand exists.

If you want to see big name companies and big name titles for the Jaguar, join in with this letter writing campaign. I'm participating in this campaign for three reasons: 1) I really think that my letter will make a difference in the decision making process at these companies. 2) I don't want to think "what if" in the future. I want to do my part now so I can say that I did my share. 3) It is my duty as a consumer to let companies know so I can satisfy my needs (or wants).

I hope you will see a need to participate in this campaign as well. And don't think that someone else will write because if that person feels the same way you do, nobody will write. The Atari Community is small and this campaign will require everyone to participate. As soon as you are done reading this newsgroup, write these companies. Make it a priority in your already busy life.

If you do not see the games you want for the Jaguar in this campaign, do not be concerned. There will be a Jaguar letter writing campaign taking place in the beginning of every month. Each campaign is strategically set-up in a way so that every Jaguar player's needs will be satisfied. But the campaigns will only work is you participate. You cannot participate in one campaign and not another. Each campaign complements the other. If you are an Atari computer user that is only participating in these campaigns because you believe it will provide Atari funds to concentrate on computers again, this is great! The result of the Jaguar's success will impact every aspect and every member of the Atari Community.

Expect a Lynx letter writing campaign to take place in the middle of each month.

There are FOUR letters to write. Its important!

1ST LETTER

As of July 1, 1994, Mortal Kombat II is not being produced for the Jaguar. And Acclaim has no plans to produce Mortal Kombat for the Jaguar. But next year, Williams will be able to release Mortal Kombat II for any game system that the company wishes to release it for. The time is now to let Williams know that we want to see Mortal Kombat II for the Jaguar.

Mortal Kombat II is by far the #1 most wanted game for the Jaguar according to the Most Wanted Games for the Jaguar listing published by CAIN Newsletter. If this game is released for the Jaguar, the name "Atari" will once again be a household name.

The letter to Williams should include:

Dear Sir or Madam,

1) How much you enjoy Mortal Kombat II at the arcades.
3) How you like the games that Williams makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get the game for the Jaguar as soon as it is released.
6) A thank you to the person reading your letter and for considering making Mortal Kombat II for the Jaguar.

The address of Williams is the following:

Williams/Bally/Midway
Attn: Console Software Development
3401 North California Ave.
Chicago, IL 60618-5889

2ND LETTER

Electronic Arts is the publisher of some incredible games such as: NBA Showdown, FIFA International Soccer, PGA European Tour Golf, NHL Hockey '94, Wing Commander, Super Wing Commander, John Madden NFL Football, Escape from Monster Manner, Twisted, Mario Andretti Racing, MLBPA Baseball, and many more! Electronic Arts also owns several other software companies that they may give the OK to develop for the Jaguar if they see there is a demand for Jaguar games.

Unfortunately, Electronic Arts is also a major backer of 3DO, a company that is a big competitor of Atari Corp.. Electronic Arts is spending a lot of time and money on making games for 3DO that it could be spending on the Jaguar.

There is hope though! Electronic Arts is a licensee. This means that the company has Jaguar developers units. Electronic Arts' management just has to give the OK to make games for the Jaguar.

The letter to Electronic Arts should include:

Dear Sir or Madam,

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your 8-bit Atari since the company was started (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) The games that you would love to see on the Jaguar (choose two or three Electronic Arts games).
6) How you believe Electronics Arts' games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games if they produce them for the Jaguar.
8) A thank you to the person reading your letter and a thank you for considering producing games for the Jaguar.

The address of Electronic Arts is:

Electronic Arts, Inc.
Attn: Production Teams
P.O. Box 7578
San Mateo, CA 94403-7578

3RD LETTER

Capcom is known for producing the Street Fighter II series of games. The company is also known for producing games such as The Great Circus Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday Night Slam Masters. The company also does conversions of popular titles such as Wizardry V and Eye of the Beholder.

Super Street Fighter II is second only to Mortal Kombat II on the Most Wanted Games for the Jaguar CAIN Newsletter list. If the game existed for the Jaguar, it would no doubt sell a lot of Jaguars. But Capcom is not making Super Street Fighter II for the Jaguar and no plans have been announced to do so in the near future.

The letter to Capcom should include:

Dear Mr. Tresidder,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do the game justice.
5) How you will run out and get Super Street Fighter II for the Jaguar as soon it is released.
6) A thank you to the person for reading your letter and for considering making Super Street Fighter II for the Jaguar.

The address of Capcom is:

Capcom USA Inc.
Attn: Mr. Corey Tresidder
475 Oakmead Parkway
Sunnyvale, CA 94086

4TH LETTER

Atari Corp. recently announced an agreement which will use Phylon's voice-data modem technology into a Jaguar Voice/Data Communicator. This Jaguar modem will allow Jaguar game players to play against or with friends that might be miles away. And it will also allow game players to talk with their friends while playing with them.

There are a few announced games that will use the Jaguar Voice/Data Communicator such as Club Drive and DOOM. But there is really no reason why ALL Atari multi-player games cannot use the Jaguar modem. Checkered Flag, Kasumi Ninja, Spacewar, Star Raiders 2000, and all future Jaguar games that are at least two player should allow for Jaguar modem play. Atari Corp. should also be doing everything it can to interest third-party software companies into making use of the Jaguar modem.

Modem games and networking games is the next generation of video gaming. Virtual Reality is still a few years away, but modem and networking games are here and now.

The main goal of this letter should be to convince Atari Corp. that the company should take steps to make all future games so that they utilize the Jaguar's Voice/Data Communicator.

The letter to Atari Corp. should include:

Dear Mrs. LaBrec,

1) How much you enjoy the Atari Jaguar.
2) How much you enjoy modem games.
3) How you believe that modem games/networking games will be an important part of the video gaming future.
4) How you would like to see ALL Jaguar games make use of the Jaguar Voice/Data Communicator or Jaguar modem.
5) How you believe that Atari Corp. should be working closely with third-party game companies to make sure that they make use of the Jaguar modem in their games.
6) How you will be more willing to buy Jaguar games that make use of Jaguar modem/networking.
7) A thank you to the person for reading your letter and for considering your suggestions.

The address of Atari Corp is:

Atari Corp.
Attn: Sandy LaBrec
1196 Borregas Avenue

Sunnyvale, CA 94089

It is imperative that you write all of these companies. Even if you do not care for fighting games, you are still encouraged to write Williams and Capcom because these companies will help get other games for the Jaguar.

And lastly, please spread information about this campaign around! Give it to your friends and have them write too! In order for this campaign to be effective, hundreds of letters will need to be sent to each of these companies. It is possible for this to happen!!! You will just need to help get the word out about this writing campaign.

THANK YOU!

246. Corel File Formats (*.BMF)

Newsgroup: comp.sys.atari.st
Date: 1994-07-05 18:05:24 UTC
From: rrice@netnews.upenn.edu
Message-ID: <2vc7d4$efo@netnews.upenn.edu>
Source record: 184248

Hello!

A friend of mine just bought a new CD rom with a great many DOS clip art pictures upon it--in *.BMF, he tells me, color format. He would need to view and manipulate them as IMG files on a monochrome Mega 4 STE. Apparently the "trial" version of GemView hasn't helped him--although he intends to register the program anyway as soon as he gets one of the American addresses for that. Does anybody have any suggestions as to what he should do?

>What we still need is a good Terminal program, I was hoping THE STORM
>would be it, but that is no longer supported, and still has a few bugs...

What I've gleaned from skimming the Storm discussion topic on Genie is that Alan has been very busy with his job, and hasn't had time to communicate with the Atari community, much less actually work on Storm. However, I seem to remember reading that he does plan on getting back to it sometime in the next couple of months (August, perhaps?). Anyone know more?

It locks up on my Mega Ste, TOS 2.05, 4 Megs ram also! The problem just
might be the amount of ram in the system. Any fixes in mind?

If you are referring to VRAM from Overscan, then it is a commercial
product and can only work on a machine with a PMMU. This rules out the
68000 as far as I can see.

(Of course, my copy of VRAM is rather old now, so maybe they did manage
to work a miracle in the meantime ;-)

] supposed to be coming out soon.
] I've used Flash 2 and I don't like it much. What do all you experts
] recommend? What do you use? Thanks....Julian.

FreeZe Dried Terminal isn't the best for Internet work, as it can't handle
VT-100, although I'm using it as I type this in ANSI mode, which is enough
for _most_ situations. (It runs & screams when IRC is activated!).

Losing Scrollback info? If you've got more than 1meg of RAM, try setting
the capture size to about 5000 lines. That is usually more than enough
for the average (lengthy) session!
```

```
] From: millert@grad.csee.usf.edu (Timothy Miller)
]
] For VT-100 and VT-102 support geared for UNIX, the one of the best terminal
] programs is ANSITerm. It handles stuff coming from UNIX virtually flawless
] and it also does 16 color ANSI graphics without any annoying flicker, altho
] it does it by using 4x8 characters (surprisingly easy to read) in ST Low.
]
] ANSITerm 1.91, is also, by FAR, the fastest terminal program available. On
] Falcon it keeps up with full tilt 57600 bps without hardly getting behind a
] all.
```

Ahh, but as the author (?) you're biased! :)

It's not bad, but someone lacking in features! (Not terribly simple Capture).

For ease-of-use, speed, and net-compatibility, don't look any further
than Uniterm or Flash (Not Flash-2 which is very slow, and quite buggy!).

They will both need an external Z-Modem, but from flash at least, this
can be set-up to happen with a single keypress!

: mipap@ars.ath.forthnet.gr

My warantee is out in two months, and the way things are, it looks like I'm going to have to make the fix myself. Where can I get two sets of the chips? I'll make the installation into a friend's Falcon also. And I need instructions too.

1040 st, B&W, with 10 meg hard disk, loads of "slightly" out of date software and manuals, including several C compilers, midi software, and other stuff. Hardware docs and drawings, and complete developer's kit. Minix for the ST, book and disk. In the end it really depends on how much shipping you want to pay for.

Any offer of $100 or more accepted immediately. But hey, what's it worth to you?

Must've been some lame DOS or Windows app; format c: return won't do
anything nasty under OS/2...

IMHO speach recognition will be totally pointless in an office... I can
just imagine the person sitting behind you saying "open
some_document.doc" and having your computer do the same... "select
all", "delete". Whoops!

Those things only let you attach "macros" to the other mouse buttons
(well, otherwise it'd be pretty useless for interacting with all the
one-button software) like "middle button = double-click" and such. Most
of the trackballs do that, too, since they all seem to have at least two
buttons.

I suppose the Linux hackers could pick one and write a driver for it...
they're all ADB devices at least (not like all the hackery you find on
the PC).

Hey John!

I don't have an answer for you, as I have not seen the game. However, I do have a cheat for it. Perhaps being able to get to the final round easily a few times will allow you to figure it out.

Ok, the cheat is easy. Get a high score, and put in the name MIAGI into the highscore table. You should then be able to press "P" to advance a level. Hope that helps.

I never managed to get VRAM to work on my Falcon. As far as I understand,
you need to have an alternative VDI manager such as NVDI, since the built-in
VDI assumes it has the blitter all to itself... and the blitter is used
for HD access... So my VRAM crashes even before the desktop shows up...

Am I correct in this reasoning?

From: lancer@wpi.WPI.EDU
Message-ID: <LANCER.94Jul5224612@wpi.WPI.EDU>
Source record: 184113

well, I was hoping Wout had added Geneva support to TeraDesk...

Guess again...

I usually use TD1.38 under Geneva for file management and launch from the Geneva Taskmanager. That still works fine under 1.39...

However, if I try to launch a program from TeraDesk with a double click, TD tries to run the program twice and then spawns itself twice as well! Yow! Sounds like a problem to me... Since launching a program from TD1.38 just put it in singletasking mode, I assume the problem is in the new TD 1.39 code...

Any suggestions?

Also, changing the string "00020010" in Pchrome 4 to "00010010" really DOES fix it for use with a MegaSTE!!! Yow!!!

I would like to know what bugs there are in Flash II. I have been using
it now for over a year, and I have not had any trouble. As for speed, I
don't see it as a slow program. It flies right along for me.

I use it on the internet many hours a week, and I have NO problems what so
ever. Please list on the net the problems that you have with Flash II.

Jut trying to get the bugs flushed out, so that they can be squashed.

take care,

Joseph

I think Harun (the author of RSVE and poster of the original message :-) is
trying to say is that the 115200 baud setting is not usable on 8mHz machines,
and that 57600 is usable only if used used with a large disk buffer and mouse
interrupts disabled. In other words, he did not want folks to get the wrong
idea from my overly brief announcement of his product.

274. vt100 animations

Newsgroup: comp.sys.atari.st
Date: 1994-07-06 03:54:51 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2vd9ub$4ce@mailer.fsu.edu>
Source record: 184122

I grabbed the vt100 animations (animations that require only a vt100 emulator to view, moving character graphics) someone mentioned and tried them with CoNnect. Wow, pretty cool! I had never seen any similar files in the past. I was quite impressed at how intricate they are (particularly the Twilight Zone one). There is also a .sig file with a moving Atari fuji in it. If you have never seen one of these, I recommend a look. When viewed properly, there are graphics made with characters that represent small line segments. If everything is made of a bunch of characters, your modem program probably cannot do VT100 properly (or does not have a real VT100 character set).

In case the site was missed, ftp to

calypso.oit.unc.edu

and cd to pub/multimedia/animation/vt100-animation

To view them, I just did "cat fname" while logged into a UNIX host via CoNnect. Within CoNnect, I have "VTxxx(IS0)" selected in the

Setup
-Character Set...
-Character Set

dialog (and "VT100" as the terminal type, of course).

From: mattk@netcom.com
Message-ID: <mattkCsIC3w.BBD@netcom.com>
Source record: 184129

HOwdy,

Perhaps I opened a can of rotten worms. I've nothing but respect for the products ICD has put out over the years. I've never needed to call support because I've never had anything from them crap out on me.

That said, I have heard a lot of sour grapes over the years about ICD. MOstly, the complaints surround the way that ICD seems to hide out. It might have been that there was bad management at one time and the problems were fleshed out. One can never tell when one is dealing with hearsay. I've no way of knowing how ICD's support in 1994 is. The complains I remember are late 1980s. Consequently, you could say that the comments are irrelevant and useless, and I probably couldn't contradict that.

As far as the bitching and moaning about various Atari vendors, perhaps my views are a bit poisoned. I've not been on the net that long, but have been in BBSes since 1984 and CIS for nearly that long. So 3 years on the Net is peanuts. But with a company like Atari which has always had a rabidly loyal following, the cynicism runs deep. I can't count how much vaporware I've seen. I can't count how many companies have folded from lack of market or simply because the kids were hungry. Atariland is like a boom town that keeps booming up and down, year after year. So those like me get rambling and put both feet in the mouth.

Sorry if I offended you. Eleven years of being an Atari fan doesn't give me the right to be careless about what I say no matter how I feel. I don't know what else to say, so I'll end here...

Catch ya later...
Matt <mattk@netcom.com>

> select VT220 emulation for this to work?

No - vt220 is not needed for this.

Try the following steps:

select connect.fnt as your DISPLAY font for the terminal (any other 'ansi' font will as well)
select 'iso' font in the FONT dialog and switch bank0 to 'american' and bank1 to multinational

Concerning the emacs meta key: make sure to have a 8Bit line in direction to the host. (this is not always fulfilled!!!) and use the ALT-key as the normal meta key in emacs. This works fine for me... ;-)

To use a phrase that's increasingly popular nowadays... I'm sorry I haven't a scooby. So it locks up if it loads the intro.... sorry can't help on this one. You aren't missing too much anyway!

(This is beginning to get confusing)

>Am I correct in this reasoning?

Yes and no. The blitter is a problem but the virtual memory manager can
solve this in most cases. The virtual memory manager OUTSIDE (by Lexicor in
the US and UK) does so.

Hello,

I'm quite new to the atari world and am accustomed to unix (may it live long and prosper). I would like to make my atari mega ste as unix-like as possible. As far as I have have read the atari
newsgroups there exists Mint which supports multitasking and unix-like shells and quite new Linux as a whole new operating system.
Could someone be so kind to tell me some advantages and disadvantages of both solutions or whether there are other possiblilties to achieve my goal ? A hint to a FAQ would be appreciated
either.

thanks in advance

Interface is (just) a .RSC file editor/creator.
ACS-Pro is a Application Builder. It does much more. It comes with a library which does all the difficult things for you (objects in windows etc.)

example: Create an object, create a window, link them together in ACS, connect a function to a button(icon etc), save. (= about 10 minutes)
Write sw which has to be executed when the button is clicked.
compile, link, ready = full gem program, multitos compatible, 3D look when wanted etc.

for more information, mail me.

Marcel.

PS. I have no gain in promoting ACS, just a very happy customer.

I would never ever trust Quick ST or Turbo ST or Warp 9, I even have problems
with NVDI 2.5, but that so far in only with one or two programs....

Install a Boot Manager, I use Xboot III, and I can recomend it some 200%,
then its so easy to have sets of TSR's/ACC/ and CPXes just for the application
that you are running, I also have setups for a bland system etc...

Nothing to do with 4megs at all, I think you are running Ataries AHDI,
try a copy of the ICD Utils or even the Supra one if you are not using BGM
partitions, the Supra one is now in the PD....

Or even buy ICD's Pro utils, far better than the Atari stuff....

I don't know anything about the functionality/speed/compatibility of redacteur, but I can absolutely confirm Tommi's statements about papyrus GOLD. I own this program since several weeks now, and I'm enthusiasted what a large functionality it has and how easy it is to use. It also works fine under MagiC (<- new name for Magix) and probably as well under MultiTOS. You can get a demo version of this program with which the maximum text length is restricted to one page (I've also heard of another demo version which substitutes some letters in the printout (a and e) so that the full funtionality can be well tested, but no serious work can be done.
I don't have the e-mail adress of the papyrus developer here right now, but if you wanted me to, I could look it up in the papyrus documentation.

Greetings,

Christoph

> not specifically supporting 38400, 57600 and 115200 baud on MODEM1.
No. Every software which is able to set MODEM1 to 110, 134 or 150 can use the high data rates. The driver provides more services than the TOS, and is much faster!

Source record: 184140

OK, as promised, I have been pursuing the possibility of getting SoftPC - the software PC emulator for TTs and Falcons, released as PD/Shareware. Insignia, who wrote the package have considered putting it out as PD, given that it will never be released officially and is already pirated to hell. Their legal department believes that the rights to it are still held by Atari and unless Atari give the OK to release it to the public, their hands are tied. If Atari are happy to release it, Insignia will then strongly consider releasing it as PD/Shareware to the extent that they are willing to advertise it as being available and sell it at a notional cost. They fully understand the revenue will be minimal but hey, they seem like nice guys :-)

I am now in the process of finding someone at Atari who knows of the product and can get an answer on this. More news when I get it.

Food for thought. Have you netter's ever thought that to get IBM to make a
game machine that Atari may have to back down of of the American market
where there computers are concerned.

IBM did not have a game machine market, but in gaining that market might
they could dictate the terms of the agreement particularly win they hold the
key to bringing new money to Atari.

Just, a thought. Would explain the loss of the Atari PR man.

I would be interested in buying this. If it does get sold, any idea where
would we buy it from?
Running basic dos programs on my Falcon (at any speed) would be very
helpful for me, but it is not worth me buying a special card (too
expensive) because I probably wouldn't use it _that_ often.

This is a joke right? Atari are in no way any kind of threat to IBM in the computer stakes. IBM probably hadn't even heard of Atari until they approached them to manufacture the Jag.

>What does the existing timing problem cause? Will my Falcon not work properly
>with some hard drives or something>?
Two known timing problems (but I do not know enough about them to give more
detail than this; your nearest repair centre should be able to help)
1. "The CPU timing problem". I believe this fixes slight instability to the
16MHz clock fed to the main processor. It was first publicised by
Steinberg, as its effect was to mess up some timing in Falcon Cubase Audio.
2. "The Timer C problem". As I understand it, this does not affect SCSI
per se (after all, my hard drive, CDROM work OK, as does my tape with
Gemar). It apparently broke the SCSI driver in DB3, which relied on
this timer. DB3.10 uses a different timer, so gets around the problem.

As I say, for more technical info you'd be best talking to a repairer or
dealer.

It's not stunning - the norton SI is about 1 on a Falcon and 1.4 or so on a TT.
It works though. For occasional use and running simple DOS stuff, it's fine.

|> Thanks for getting the info!
|> (I'm sure this is a great help to lots of people)
I just hope I can get something going here after all the interest that has been shown..

|> BTW how much do 68882's cost and what programs can use it? Does it make
|> that much difference?
I paid 35GBP for mine. Beware that there are a and b mask ones. Get a b mask - I'm told it's a lot quicker. Not a lot uses it though. I bought it to run a 68882 version of POV. There are a few commercial progs like raytracers that use it and if you program, you can get your compiler to produce 68882 aware versions of your code.

: > version of the ICD utils....
: >

: It's definitely the HD driver. It might help if I remembered to check which
: drivers I'm using at the moment! It's a fairly recent version of AHDI,
: anyway.

I have to agree with Ross here and blame it on the HD driver (and according to
Dave Oldcorn the underlying TOS version is involved too). I too have the
'can't run from hard disc' problem and Dave suggested I change my driver to
an ATARI one (I was running a non-atari one written by some bloke called
Illias Lazaridis ????? Who ??). Anyway, I installed Atari's AHDI V5.00
(dated Dec 1991) and it still doesn't work, however, the problem is
different now, so this proves that the fault type is dependant upon the
version of the driver you are running.
Does anyone know where I can get my hands on the very latest AHDI from
Atari (ftp site ?). I know it's at least V6.1 'cos there's a file on
a.a that upgrades the driver from 6.0 to 6.1 but I assume you have to
have 6.0 in the first place before you can make this upgrade ??
Someone correct me if I'm wrong.

Cheers,
Grant.

Ray, have you been smoking that 'funny' tobacco again??? :)

I've read your post a dozen times and I _still_ can't make any sense out of it. I don't know whether you meant this seriously or just as an ill-informed joke. IBM does not have a game machine market. They only manufacture the Jag for Atari and don't dictate _any_ terms as to how it is marketed. And Bob Brodie (I assume that's the PR man you meant) quit Atari of his own choice for entirely personal reasons.

And whatever your comments had to do with Ian's post about SoftPC is a mystery!

>I'm very curious. What language is that? And what is meant by the doubled
>vowels? Elongated? Is a 'j' in this language like in German or French?

This is Dutch. The guy's Atari 520 ST has died and he wants to get it
repaired somewhere in the neighbourhood of Amsterdam.

As for the vowels... take for example 'waar' and 'kan'
-- -
in the first case it's a long sounding 'aaaaaaa' (well, no that long :) and
in the second case it's a short 'ah'. I try to think of English sounds which
sound the same, but I can't think of any. The Dutch sound of an a is not
in the English sounds.

yes, the 'j' is like the 'j' in German (a closely related language) but
not in the case of 'ij'. Then those two together have the sound of a vowel
sounding a bit (I say a bit!) like a 'y' in the English word 'fly'

Regards,
Ivo (You probably pronounce this wrong also... :-)

Yes there is a german shop "Pagedown" I think, which distributes Script V3.5
and they had a really cheap special offer for it. Since we used Script 2.0
we tried to update, but that made no sense, they offered the update for DM170
and their special offer was DM130. Bizarre, but true!!
My girlfriend is using the Program mostly with Speedo-Fonts now (I am a
TeXnician) and I liked what I saw. She hates computers and software even
more, so when she can handle it, it has to be a nice program.
Sorry that I have no address for "Pagedown". If you really need it send a
PMail to me.

Just wondering if anyone knew of a half decent video titling program that one could use with the st. Nothing fancy (I don't have genlock) I'd just like to create some nice titling effects with perhaps some animation with the letters and choices of several fonts. So far I've just been using Degas and a program called Shadow. I've come accross a shareware prog. called TV_Title, but it bombs before it can load. Anyone had any luck with this program? I'd appreciate any help I could get with this.

Was this the normal opto-mechanical jobbie? Coz I've heard that the optical
one is pretty good - nice and smooth.

Another mouse to keep away from is the Golden Image optical mouse.
The mouse mat (which you NEED) is really naff, thin and floppy, and the
bottom of the mouse has sort-of foam type stuff while the mat has a
shiney surface. (opposite to a normal mouse). There is so much friction
between the two surfaces that the mouse has a really nasty feel to it
when you're moving it about.
Having said that, the pointer never 'slipped' as it often does on my
ball mouse, which is why I'm looking for another optical.
Oh, and mine conked out after 2 months too.

I have exactly the same problem! My setup is a new Maxtor 345Meg SCSI with an ADSCSI+ ICD board and the included software (about 4.8.5). I can't even access the HD to try to reformat it. I have a few hints:

1) Could be a bad DMA chip;
2) Are you using an STe with TOS 1.06? I am, and I hear this release has trouble talking to quick SCSI devices;
3) Could be my old ICD software;

If you learn anything more about your troubles, please email me. BTW: My Megafile 30 still works just fine when I hook that up. Its just the SCSi that is skewed.

The Gemulator is a commercial product. It is not available via FTP.
You should be able to obtain one through any reputable Atari dealer.
Or you can contact the creator, Darek Mihoka, at darekm@microsoft.com

From the Holy Book of <1994Jul6.132243.3853@jet.uk>
as spake by djs@jet.uk (David Stevenson) :

>Uniterm (I have v2.0e) only runs in ST-High.

This comes as something of a shock to me, as I've been using Uniterm successfully in ST-Med for going on six years now... ;) I assume you mean it doesn't run in any of the higher resolution TT/Falcon screen modes.

>Connect looks like it might be a better bet.

If you have a screen resolution of 640x400 or better and NVDI or similar, it probably is. Otherwise, I'd go with Uniterm.

I am really puzzling about CD-ROM drives: (1) Kent Kordes (Systems for Tomorrow at Independence MO) offers a $99 drive that uses a SCSI connector [it's an NEC CDR25 150kbyte/sec with 800msec seektime] ... and I am curious to hook up a CD-ROM drive to the old Mega4 STe ... but then there's today's Wall Street Journal with a headline about disappointed CD-ROM drive buyers who are even more disappointed with the extremely low quality of the CD-ROMs available to buy (ugh!) ...

What genuine opinion from some USERS ????????

I believe IBM simply came in as the low bid. My understanding is that
Atari fully expected the Jag to be made in Taiwan or some other similar
cheap labor area. IBM Connecticut getting it was probably a big surprise.

333. 1040st system for sale (austin,tx)

Newsgroup: comp.sys.atari.st
Date: 1994-07-06 20:25:47 UTC
From: drray@bga.com
Message-ID: <2vf40b$38b@lia.bga.com>
Source record: 184077

This CPU is in the austin, texas area. And local buyers get first dibs.

Atari 1040STf (1 meg ram, tos 1.2) internal DSDD drive.
Atari SC1223 Color Monitor
Atari SMM804 printer
2400 baud modem with cable
1 joystick
3 mouses or meese?
1 deskcart

Misc Original games.

Couple of issues of STformat.

Plus - Abacus Books - ATARI ST Machine Language
ATARI ST GEM programmers reference
ATARI ST Internals

Everything is in excellent condition.

Asking $150 OBO buyer picks up and pays in cash please..

Email me if interested..

I might be willing to ship if noone in austin wants it. And we can work
out terms.

I am not a STOS expert, but there seem to be a lot of files on atari.archive
that deal with patching various things in STOS to work on various versions
of TOS. You might check these files out and find an answer. Look in the
index files for /Languages and /Programming.

342. Re: SIMILAR REPOST: Jag Letter Writing Campaign (read me)

Newsgroup: comp.sys.atari.st
Date: 1994-07-06 23:38:24 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <94187.193824STIRRE31@MAINE.MAINE.EDU>
Source record: 184089

I'd mostly agree with your post. However, Atari has stated, I believe,
that they will be earmarking around $35 million dollars for
advertising this year which brings it very close to 3D0's figures.
Atari seems to be waiting till the end of 1994 which is a good
strategy. I believe they will put on a media blitz at year's
end and if the games are available (30-35 including Doom (Wolf 3D
is now out, BTW)) the Jag will sell well. Atari has cut operating
costs now to the point where I believe that they can stay in business
whether they sell as many systems as Nintendo or not (which they
won't). Atari's strategy of having system sellers just may work.
AvP, Doom, Wolf 3D and Tempest 2000 by themselves will justify
the cost of a Jag in many gamers' minds. How many people wanted
faster IBM systems to play Doom? Quite a few.
You are probably right about waiting, though. I'd be kinda weary
about buying any game system right now. But the Jag definitely
is the best on the market, IMO.
-scott tirrell

343. Re: SIMILAR REPOST: Jag Letter Writing Campaign (read me)

Newsgroup: comp.sys.atari.st
Date: 1994-07-07 00:02:33 UTC

Message-ID: <R+3RxnZ.ari2550@delphi.com>
Source record: 184084

I know I'm gonna catch alot of flames for what I'm about to say but...

Why bother??? Seriously, a letter writting campaign might make you feel
better but it sure won't change Atari corporate decisions.

We have to stop trying to be backseat managers. We can scream all we want
until we're blue in the face for Atari to do this or to do that, etc.
However, we must be realistic about Atari's limitations.

Atari HAS about $35 million in cash and marketable securites left. This
is not a whole lot of money when you consider the industry they're in
and they have to spend alot of that money on such mundane things like
interest expense, rent, salaries, R&D all in addition to marketing.

After all of that, Atari may have a few million to spend on marketing...
Remember, the industry is competative and media like magazines and TV are
extremely expensive. I'm not sure if they have the dough to make a dent
in an industry obssessed wh Nintendo and Sega.

Then, you have to take into account the fact that most potential Jag consumers
won't be like us on the net - they will be ignorant, pizza faced teens and
pre-teens who don't care if the Jag is the most advanced system out but
rather if it has the games they WANT!

Most Jag developers are small-time operations. The low price of the Jag
development system and license is a major reason. If the Jag was selling
big numbers this would be great - but, the reality is that most of these
developers are part-time operations with little or no capital. This means
they can't pay their staff up-front, they can't market their own wares, and
they can't afford to spend full-time on their development, so games will
take substantially longer to come out.

Now, if Atari could convince some big names to defect over to their camp
and develop and they CAN ACTUALLY deliver the hardware they've been promising
then Atari might make things turn around. If not, they are dead.

I like to play it safe. I'm gonna wait and see.

Just my two cents.

Ari

MONDO BIG SALE! 290 STILL LEFT!
==========

Well, I've sold a LOT of stuff, but still have a lot left. I'm leaving on vacation soon and would like to sell as many as possible before then. I don't expect to sell everything, but I have lowered the prices on all items so that things will move faster. Item prices are still negotiable.

I also have a complete collection of Infocom games that can be sold as a set or separetely (they're really text adventure games).

Text from before:

All these used ST titles are for sale, everything is going. Most are only one piece items, so it's a first come first serve situation. All prices are NEGOTIABLE, and the highest price takes the item (no matter what the price, like it says, everything is being sold). Please notice the stress on the word negotiable.

Everything is in good condition and works, send e-mail if interested.

Also, if you are looking for PC (Dos or Windows), Macintosh, Apple II, Amiga, Commodore 64/128 or other tiles, please e-mail to get a list of those items.

348. NVDI, GDOS fonts, and GEM NetHack

Newsgroup: comp.sys.atari.st
Date: 1994-07-07 03:44:37 UTC
From: warwick@cs.uq.oz.au
Message-ID: <2vftn5$19v@uqcspe.cs.uq.oz.au>
Source record: 184096

Could NVDI use a 4-pixel wide font for the standard screen font?

I have a 4-pixel-wide GDOS font that would make my GEM NetHack playable
on ST's in low resolution (GEM NH needs 80 columns, 16 colours).

I was considering making GEM NH able to use GDOS fonts in all dialogs
and windows, but this is a great deal of work for something I personally
will never use (I run it in 800x488x16).

349. Want to borrow/rent Atari ST (Wash., DC)

Newsgroup: comp.sys.atari.st
Date: 1994-07-07 04:14:13 UTC
From: glennj@cs.umd.edu
Message-ID: <2vfvel$id4@ringding.cs.umd.edu>
Source record: 184097
Cross-posted to: comp.sys.atari.st,dc.forsale

When I sold my Mega STe a while ago, I didn't have a chance to get the data off my hard drive. Now I need some kind-hearted person to let me borrow an ST so I can finally get it off! I need an ST with at least TOS 1.4 (so I can read my 32Mb partition), a mouse, and a working floppy drive (720K or 1.44Mb). I am in Annandale, VA and am willing to drive about an hour to pick up and return the computer. I would like to do this this weekend (7/8), but I can do it early next week too. I will probably need your machine for three days. In return, I will give you

Two of the following (all have docs unless noted):

Dungeon Master
Shufflepuck Cafe
Spectrum 512
MaxiFile (v2.0, 1989)
Quick ST (v2.1, '90; has registration card)
Populous
Flash! (v1.6, 1988)
1st Word Plus (v2.02, 1987)
War in Middle Earth (I think this had a map. I've lost it)
DC Desktop (v1.0, 1990)
DC Utilities (v2.0d, 1990)
Bubble Bobble
Valgus^2 (registered shareware Tetris derivative)

OR, one of the following:

STalker (v3.00, 1991)
STeno (v2.00, 1991; has registration card)
pc-ditto
Data Diet (v1.0, 1991)
Lemmings (in box, never used)
Replay 4 cartridge (has software, no docs)
Ultima V (I'm looking for the docs, contact me for a status report)

OR, credit towards the following (listed with asking price BEFORE credit):

SC1224 color monitor ($100)
ICD host adapter & case w/50Mb Seagate HD ($100)
Okidata 182 9-pin printer ($50)

OR, a small amount of cash.

I will test things for compatibility and operation when I get your machine.

Jim Glenn glennj@cs.umd.edu

351. Re: SIMILAR REPOST: Jag Letter Writing Campaign (read me)

Newsgroup: comp.sys.atari.st
Date: 1994-07-07 05:17:28 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <2vg358$9ji@usenet.INS.CWRU.Edu>
Source record: 184099

In a previous article, ari2550@delphi.com (Ari Feldman) says:

>I know I'm gonna catch alot of flames for what I'm about to say but...
Ari, you are right, you are going to receive a lot of flames about this only because you obviously did not ___READ___ the message that you are responding to!

It bugs me to no-end when people read a few sentences of a message and then write a response which is already covered in the original message...

>Why bother??? Seriously, a letter writting campaign might make you feel
>better but it sure won't change Atari corporate decisions.

For one thing, this letter campaign has nothing to do with the decision making process at Atari Corporation.

>
>We have to stop trying to be backseat managers. We can scream all we want
>until we're blue in the face for Atari to do this or to do that, etc.
>However, we must be realistic about Atari's limitations.
>
>Atari HAS about $35 million in cash and marketable securites left. This
>is not a whole lot of money when you consider the industry they're in
>and they have to spend alot of that money on such mundane things like
>interest expense, rent, salaries, R&D all in addition to marketing.

If you'd read over the original message, you'd see how really stupid you look for writing this.

The campaign asks NOTHING of Atari but to use multi-player features in their games. That is it. NO advertising demands are asked nor does the letter writing campaign ask of Atari to spend ANY money.

The campaign is directed at game companies who have not yet signed to develop popular games for the Jaguar. This includes Mortal Kombatt II, Street Fighter II, and Electronic Arts games.

>
>After all of that, Atari may have a few million to spend on marketing...
>Remember, the industry is competative and media like magazines and TV are
>extremely expensive. I'm not sure if they have the dough to make a dent
>in an industry obssessed wh Nintendo and Sega.

Again you are rambling on and on about nothing.

>
>Then, you have to take into account the fact that most potential Jag consumers
>won't be like us on the net - they will be ignorant, pizza faced teens and

>pre-teens who don't care if the Jag is the most advanced system out but
>rather if it has the games they WANT!

THIS is EXACTLY the point of the campaign. To make sure the games are out
there that EVERYONE wants. Read over the message.

>
>Most Jag developers are small-time operations. The low price of the Jag
>development system and license is a major reason. If the Jag was selling
>big numbers this would be great - but, the reality is that most of these
>developers are part-time operations with little or no capital. This means
>they can't pay their staff up-front, they can't market their own wares, and
>they can't afford to spend full-time on their development, so games will
>take substantially longer to come out.
>

The original message mentions that the Jaguar developers Atari has now are
small and it may take them awhile to make games. That is why the campaign
is concentrating on known game makers. Read over the message.

>Now, if Atari could convince some big names to defect over to their camp
>and develop and they CAN ACTUALLY deliver the hardware they've been promising
>then Atari might make things turn around. If not, they are dead.

The Jaguar letter writing campaign is to help Atari convince big names to
defect to their camp and develop. Read over the message!

>
>I like to play it safe. I'm gonna wait and see.

Do me a favor Ari, read over the messages completely before you reply to them.
You won't look so silly next time!

Len
>

\_______________________/ \____________________________/
```

For all who have shown interest in the OMEn operating system, this
newsletter will bring you up to date with OMEn developments. Other
readers should call, write or fax to be placed on the regular mailing
list.

```
_____________________________________________________________________
/ What Is OMEn? \
| |
| The Open Multitasking Environment (OMEn) is an open architecture, |
| true preemptive multitasking operating system based on the 680x0 |
| processor family. It is also a graphical environment where the |
| user has free access to all commands and features, even while |
| running multiple programs simultaneously. |
| |
| OMEn is a modular system in which I/O function files are created |
| and configured without reference to the system core. It can thus |
| be interfaced with ease to any type of hardware and to any type of|
| software protocol, existing or new. This includes printers, disk |
| drives and file systems, networks, input devices, displays, GPIB |
| devices, industrial controls, MIDI, multi-media and so on. |
| |
| OMEn is intended to run on most current 680x0 based computers |
| (Macintosh, Atari, Amiga) including older low end models, as well |
| as PC (via a 680x0 card) and new machines such as Power PC, DEC |
| Alpha and Pentium by 68000 emulation and other techniques. |
| Implementation progress for individual machines will be detailed |
| in the OMEn Herald starting with this issue. |
| |
| The OMEn interface is nearer to UNIX X-Windows than to any other |
| interface, but OMEn's size is a fraction of UNIX, and the generic |
| object oriented drag-&-drop interface is unique. In addition, |
```

| since a single version of an application program or I/O protocol |
| interface will run on all computers, OMEn, in critical areas, is a|
| much more open system than UNIX. |
_____/

Feedback

We invite your comments and suggestions so that we can improve usability for programmers and users.

OMEn General Progress

Conceptually, the basic OMEn system is now completely implemented except for font dictionary implementation and configurable bootup.

Current targets also include the addition of more display/print commands, printer protocols, and file manipulation features. Network file client protocols for Appletalk servers are also under consideration.

In addition, much of the documentation is just now being prepared for release.

Development Tools

A structured 68000 assembler and FORTH language run in OMEn. Atari-GEM based compilers may also be used. The next issue will include more coverage on this subject.

OMEn for Atari

Atari is the original OMEn development system, so OMEn for Atari is currently the most advanced, making use of a number of special Atari hardware features, such as a scrolling display giving more room for windows. ST, STe and TT features are fully supported and digitized audio works on ALL models. Special Atari disk formats such as 800K and 900K are covered as well as DOS standard 720K. Falcon video modes will be supported before release. An OMEn release for Atari (with development tools) is planned for 2nd quarter '94. Please reply to receive your copy!

OMEn for Macintosh

OMEn for Macintosh is now running on 68000 based machines: 512K & Plus, SE and Classic. The current version works only with monochrome displays. No 68030 Mac has been tested yet.

OMEn programs that ran on the Atari ran unchanged on the Mac. Software protocol files also worked unchanged. For example, the DOS disk file protocol used DOS disks properly on Macs capable of reading them. Thus one of OMEn's key features, complete software portability except for the core and I/O ports, is finally demonstrable. (A Mac disk file protocol has yet to be created... Here we have Macs that will read DOS disks, but not Mac disks!)

Does anybody know if it would be physically possible to read 720K DOS disks on a Mac Plus if the appropriate software was written to go straight to the hardware? These are the ONLY machines for which OMEn software couldn't be distributed on a 720K DOS disk.

OMEn for Power PC

If Apple's 680x0 emulation is flawless, OMEn for Mac should run on the Power PC without any changes. It is more likely that there will have to be some amount of adaptation.

OMEn for Amiga

Well... we've got Amigas! (500, 2000 & 1200) What would help now is if some Amiga hacker fanatic in the Victoria BC area would like a bit of contract work sitting in and spelling out Amiga details to assist in adapting the OMEn core to run on Amiga. It took four days to get OMEn running on the Mac, so Amiga should take two, right?

Marketing Strategies

On 680x0 based computers such as Mac, Atari and Amiga, OMEn is simply software on a disk. The shareware marketing method will be employed with the versions of OMEn for these computers, and also for our software development tools. Contrary to popular belief, people have made their million(s) with shareware with a good product and careful business planning.

For software publishers, the wide availability of OMEn as shareware will guarantee its accessibility to their customers. A growing list of OMEn features and computer compatibility will result in steadily expanding markets for OMEn software.

OMEn for PC requires a circuit card, so it cannot be distributed as shareware. It will be marketed at first by direct mail for developers and early users, with distribution through regular marketing channels to follow as volumes increase. The 68331-ISA card with OMEn-PC will be about $199 plus the price of two SIMM memories required for the card. (Volume sales should reduce the price significantly.)

System Tidbits

Topic This Issue: System Calls, I/O Calls and I/O Commands

With OMEn, internal system calls (for you hackers: 680x0 line-A traps, starting at $AFFF and working downward) are distinct from I/O calls (trap #4-11 instructions), which are handled externally.

A system call is dispatched inside the OMEn core, while an I/O call is dispatched through an I/O channel to separate files loaded into memory at startup: a Protocol Translator (software I/O interface layer) and an I/O Port (hardware I/O interface layer). In special cases (display, inter-task mail...) the two layers may be combined.

When an I/O CALL is made, the application passes an I/O COMMAND (in D0.word. Any further parameters are in other registers) that tells the Protocol Translator (or the I/O port directly) what operation is to be performed. For example, passing "A" (hex code $0041) means "output the letter 'A'". passing -1 (hex code $FFFF) means "scan for input and return it if any" (else return "NoInputData" error). Code $141D is "Draw Line"; $1805 is "GetFile", and so on to cover every implemented I/O function. (Additional parameters are passed in other registers by commands which require them.)

Next Issue

OMEn for PC is underway, and it has some unique hardware features afforded by the 68331-ISA card. "System Tidbits" will feature the dynamic memory management system that allows practical true multi-tasking without memory management hardware. Software development tools for OMEn will be given the once-over.

This probably isn't a lot of help, but I heard of Maple (algebraic manipulation package similar to MathCAD w/o the graphics, right?) through an article in BYTE magazine. It specifically mentioned the Atari version as well (which kinda surprised me).

Anyway, it was probably around 90-91 if anyone has access to back issues. The article was several pages long, and covered MathCAD and Mathematica as well if I remember rightly.

Hope that's some help...

Why don't you grab ANSITerm? It is shareware, and supports Zmodem (with
XZY.TTP). That's what I now use after years of using Interlink...

360. Atari User Group

Newsgroup: comp.sys.atari.st
Date: 1994-07-07 09:12:15 UTC
From: vctec@westminster.ac.uk
Message-ID: <CsKC3J.2nw@westminster.ac.uk>
Source record: 184006

Hello

If you know of anyone who may be interested, then please pass this info onto them. Although meetings will be held initially in the North West, we do hope to go national at some point (a big hope), and also hope to hold national meetings some time in the future.

People from all over the country are welcome to join.

--------------PRESS RELEASE----------------

A new Atari support group has been set up in the North-West of England.

Known as "Manchester Atari Group" (MAG) it will be providing free technical support, regular meetings, a newsletter (the "MAG mag"), a free Public Domain service (through 'CyberSTrider'), and reduced shareware fees on selected software.

It plans to open a BBS for members in the future. Meetings will feature demonstrations of current hardware and software, and discussions of past experiences and problems.

MAG has been set up by two experienced Atari enthusiasts, Steve Taylor and Denesh Bhabuta, owing to the need for an Atari community in the North of England.

The first meeting will be organized when an idea of the number of interested people is known.

For more information, contact Danny (Denesh) on 061 796 5864 (evenings), or Email [danny@micros.hensa.ac.uk].

MAG is a non-profit making organisation.

-------------END OF PRESS RELEASE-----------------

>market for micros. Now there isn't except in regards to price.

I don't understand the price thing here. When I bought my first
ST, a 1040 with colour monitor and a 20 meg drive cost about $1800
Canadian. It was a lot better for the price than the 286's that were
available at that time for more money. Now, local PC dealers are selling
486/66 systems with 340 meg hard drives for $1799. Seems the price of a
reasonably decent computer is always at the slightly under $2000 mark.
If you want the equivalent to a 1986 520 with a 360k floppy and
color monitor, the 386/40 system you mentioned is about the right price.

On a completely different subject (but still Llama related), I still
can't get Llamatron to work on my Falcon with Backward. There
is no option of STE emulation as far as I can tell which I'm told
I need.

Which ST emulator do I need to get Llamatron to work on my Falcon.

/ What Is OMEn? \
|
|
| The Open Multitasking Environment (OMEn) is an open architecture, |
| true preemptive multitasking operating system based on the 680x0 |
| processor family. It is also a graphical environment where the |
| user has free access to all commands and features, even while |
| running multiple programs simultaneously. |
| |
| OMEn is a modular system in which I/O function files are created |
| and configured without reference to the system core. It can thus |
| be interfaced with ease, and BY ANY DEVELOPER, to any type of |
| hardware and to any type of software protocol, existing or new. |
| This includes printers, disk drives and file systems, networks, |
| input devices, displays, industrial controls, MIDI, multi-media |
| and so on. |
| |
| OMEn is intended to run on most current 680x0 based computers |
| (Macintosh, Atari, Amiga) including older low end models; PC via |
| a 680x0 card; and new machines such as Power PC, Alpha IPX and |
| Pentium by 68000 emulation and other techniques. Implementation |
| progress for individual machines is detailed in issues of the |
| OMEn Herald. |
| |
| OMEn interface operation is nearer to UNIX X-Windows than to any |
| other interface, but OMEn's size is a fraction of UNIX, and the |
| generic object oriented drag-&-drop interface is unique. In |
```

| addition, A SINGLE VERSION of an OMEn application program or I/O |
| protocol interface will run on ALL COMPUTERS, making OMEn a much |
| more open system than UNIX in this critical area. |
_____/

Two Good Reasons To Write Software For OMEn

1. It is plain that under current market conditions, Atari and Amiga have become dead-end systems, and even Apple is failing to gain its share of the expanding market. The pool of 680x0 programmers is split into incompatible camps based on each proprietary brand of computer, while the pool of Intel programmers are all writing for the same non-proprietary systems.
OMEn will run on all 680x0 machines (including PCs with the 680x0 card, and RISC machines by emulation) independently of the fortunes of any one particular computer company. It is the only system conceptually capable of reversing the well-developed trend toward a closed Intel-Windows marketplace, and bringing good market share to 680x0 based and open architecture systems.
OMEn will be viable on almost the entire installed base of existing computers, from the oldest 7 MHz monochrome Macs without hard drives to the latest mega-feature machines. The potential market area for OMEn software is thus set to the widest possible limits, and developers who start early will have a head start on penetration of the platforms not covered by early releases. This could propel small companies from fringe markets to advantageous positions in major markets.

2. There's just one operating system to know for any and all machines, and it's a straightforward, easy to learn and use system. OMEn software makers will not have to know a variety of systems to hit all the potential markets for a program.

OMEn General Progress

Conceptually, only configurable bootup remains to be tackled for a complete open architecture operating system. It is intended that a text based "Boot Script" somewhat akin to DOS'es CONFIG.SYS and AUTOEXEC.BAT will be used to install desired I/O drivers, preferences, startup applications and miscellaneous at boot time.

A scaleable font handling system is now in place. It currently manages certain Postscript Type Three fonts which use a simple text based definition system editable with a text editor. These fonts are easy to add extended character definitions to. They mesh neatly with the rest of the scaleable graphics system, which uses the same definition format, which we call "ZipScrip". An example of an object defined by ZipScrip is:

```
n New object
0 200 m Move to co-ordinates 0,200 (X,Y)
0 700 l Draw a line (from 0,200) up to 0,700
```

100 700 l From there, line right to 100
500 700 500 200 100 200 c Then a big curve back to the bottom
e End polygon with a line back to the start
f Fill it in. It's a filled in "D" shape.

On a similar note, the "code page 437" character set (the IBM extended character set) has been adopted as characters 256 to 383 (hex 100 to 17F) of the OMEn character set. Character codes 384 to 1023 (hex 180 to 3FF) are currently reserved. The single byte defined character set is:
0 to 15: Control Characters (End of File, NewLine, Wordwrap, etc)
16 to 31: Extra OMEn printing characters (arrows, checkmark, etc)
32 to 127: Regular ASCII printing character set
128 to 255: Various non-printing commands (SetColors, bold, italics, SetTabs/Margins, PrintExtendedChar(>256), SetFont, ...)

Release Dates

The OMEn release for ATARI with development tools and documentation is still planned for 2nd quarter '94, probably in April. Please reply to receive your copy!

A preliminary MACINTOSH release for 512K, Plus, SE, Classic, SE 30 and Classic II will also be available upon request at that time. (The Classic III hasn't been tested.) Monochrome displays ONLY, of any size, will work, and Mac hard drives are not accessable. 68030 based machines with color or shades-of-grey displays are currenly not working, even if set to two-color mode in the "Monitors" control panel. OMEn starts up fine, and applications run okay, but everything "freezes" after about 20 to 30 seconds. (Ideas are welcome.)

The same OMEn software runs on both the Atari and the Mac. Since Mac Plusses can't use standard format DOS disks, a special feature called "DOSsify" has been added to convert an 800K Mac disk into an 800K DOS software compatible disk that works only on Macs. Transfer of software from/to real DOS disks must be done running OMEn on a Mac that can read both formats.

Development Tools

The current tools for software development within OMEn include a general purpose word processor (editing code, documentation, writing OMEn Herald, etc.), a structured 68000 assembler, debug monitor and a simple paint program for making icons, etc. The crash (/debug /breakpoint /single-step) window in the OMEn system is also very useful. Although they are separate programs, OMEn features allow the cursor in the word processor to jump instantly to compiler errors found in assembly. Documentation includes "The Software Development Process with Eazy-Asm" to quickly introduce you to the most effective use of these simple but powerful tools. Source code, documentation, debuggers, and the program under test can all be on screen at once.

In addition, Atari-GEM format programs (sorry, NOT GEM programs, just the GEM executable file FORMAT!) will work with OMEn, making it possible to use GEM based compilers (Assembler, C, Modula2, Pascal, etc) to write OMEn software. The development setup would include an Atari computer running the compiler to create the program, and any computer running OMEn to test it on, with a floppy disk being used to transfer the program to the test machine. Until appropriate interface libraries are created, a bit of in-line assembly will be required here and there for OMEn system and I/O calls.

GEM based compilers could be modified with relative ease by their creators to run in OMEn, where they would work on any OMEn machine as well as Atari!

OMEn for PC

Since OMEn is a 680x0 based system, it does not run on Intel processors directly, but the strength of the PC architecture is that new hardware can be added on bus cards.

OMEn for the PC is currently under design with a 16.68MHz 68331 card. This is equivalent to a 22.24MHz 386SX because the '331 takes three clock cycles to access memory while the '386 takes four clock cycles. The PC does all the I/O including video, and the card does internal processing. In PC terms, the top speed of the system would be the speed of the PC plus 22 MHz!

The prototype card will be ready in the next month or two, but it will take further time to get OMEn running on the PC. Two DRAM SIMMs (30 pin, 8 or 9 bits wide) are required. SIMM size may be from 256KB to 8MB, giving 1/2 to 15MB (the card's limit) of memory. Odd size SIMMs (512K or 2MB) will work.

The card has an 8 bit stereo/16 bit mono audio output, a serial port (Appletalk compatible?), and a special synchronous serial port for control applications. With some restrictions, the memory on the card can be used as DOS/Windows extended memory if OMEn is not in use.

System Tidbits: Writing an Application

We had planned to feature the dynamic memory/file management system, but patent considerations preclude it this month, so here is another topic: The steps to writing a typical OMEn application.

The structure of a simple OMEn application can be as follows:

1) Title, copyright, and includes (include OMENEQU.TEXT)
2) Define storage requirements for scratch memory
3) Initialize the program
4) The Event Loop
5) Subroutines (as required)
6) Place or VInclude Constants

Initialization (3) can be broken down as follows:
a) Open a window (or menu/dialog box). This is a simple step

requiring five machine language instructions, which includes checking for error.
b) Open and initialize scratch memory as required. Opening (allocating) memory is also a simple proceedure.

The event loop (4) should handle at least the following events:
a) #CloseWw (Close Window) If there is only one, the appropriate response is to end the program.
b) #RedrawWw (Redraw Window) The display protocol manager sends this when a window is in need of updating, including when it is first opened.
Some other events that are commonly handled are: #<$400 (text/keystroke event), #Click (mouse), #DragFile (open file or ?), and #AboutWw (tell about program or window). There are many more events such as #TaskClosing (another program shutting down) and #DisplayAttrChange (change of display mode or zoom) which may be handled or ignored as desired.

The constants section (5) includes such items as menu text and window definitions. Whole files such as Icon pictures or digitized sounds can be inserted into the program with the structured assembler's VInclude (Verbatim Include) feature.

These steps are all simple. An example runnable program can be as short as 1/4 page of assembly code.

Next Issue (April)

Atari Release Notes. More good reasons to write software for OMEn. Real-time Control.

OMEn General Progress

A name has been coined for one of OMEn's major features: it's "componentware". Componentware was the feature article in April BYTE magazine. OMEn is a componentware operating system where applications and I/O managers become components of the system as a whole.

OMEn for ATARI has been released and the OMEn software development system will be ready by the time you're reading this.
Virtually all attention for the past four months has been focused on getting out OMEn for Atari and the OMEn software development package, and the documentation required for these. There was no OMEn Herald in April.
Now that this project is complete, attention can be focused on portings to other computers and system and utility software improvements, as well as promotion and business contacts and contracts.
The latest new improvement, just completed, is the ability to save video display mode and view size preferences for restoration next time OMEn is run. The first version Laserjet laser printer driver is also completed. Next on the agenda is improvements to the Text Ed program.

Mac: The 68030 problem has been solved. Some newer model Macs, and some types of displays are still being uncooperative. The four main work areas to bring out a fully functional Macintosh version are (1) Colour Displays. The driver will be in the works shortly. (2) HFS disk management. (3) Solve the compatibility problems. (4) Misc.
The same OMEn software runs on both the Atari and the Mac from GEM/DOS disks.

Amiga: Although some routines are working, the Amiga porting contractor has been too busy with other work to complete his assignment, resulting in much delay to the Amiga version.
The demise of Commodore leaves just three distinct systems in the low-cost spectrum of the computer manufacturing business: Atari (barely), Apple, and PC compatibles. The few low-volume Unix systems at the higher end don't seem to run each other's software.

PC: The prototype circuit card has been fabricated but is not yet tested. The PC end software has not been written. A contract with a local software company for this work is pending further discussions. If it goes through or other arrangements can be made, the PC version could be out in three to six months; otherwise, it has a lower priority than the Mac and Amiga versions.
Enthusiasm for OMEn related contracts by local companies should improve as OMEn starts to spread around and third party software is in the works. (Yes, there are interested developers.)

ReleasED Date

OMEn for ATARI (version 2.46) was finally released on "D-Day" (Demo-Disk-Distribution-Day), June 6th 1994. This was later than planned, but it seems like a fitting day as many copies went to Europe. OMEn

2.46 is greatly improved over the late March rendition previewed for June Atari ST Review magazine, and 2.47 is still improving.
To receive the FREE demo or to order a licenced copy, just call, fax, or write. You can leave a message 24 hours a day, and it is safe to leave a credit card number. The demo is also available for downloading in archived form on GEnie and a number of local bulletin boards in different areas.

Three More Good Reasons to Write Software For OMEn

1) Because of OMEn's modularity, third parties will be able to write software protocol managers and I/O port drivers for any protocol, device or I/O system just as easily as writing application software. For example, if you think Esquimalt Digital's audio manager isn't very good, or you'd like to have audio run through your "Super Stereo Atari Cartridge" port instead of the internal system, that's a market opportunity instead of a compatibility problem. All audio in existing or new OMEn software can be re-routed through your system. Or, you could write a file protocol manager for Mac(HFS), Amiga, Unix, ISO9660 CD or Photo CD disks if you've worked with one of these disk formats. Or support Novell Netware, or currently unsupported printers? Anything but the small OMEn Core (copyright, patents pending) is fair game.
Companies locked out of creating useful system level software products by current closed systems can gain a stake in their best areas of expertise with OMEn. Those making hardware accessories will have the ability to make their products compatible with existing and new software. OMEn users will be much less dependent on one company for improvements to the system as they are with other systems.
PS: We'll sell source code for adaptation. Divide the size of the object file by 100 to obtain the price in Canadian dollars. I.E. the Dot Matrix Printer protocol at 4048 bytes, would be $40.48.
* * * * *
2) OMEn makes assembly language portable. The biggest argument against coding in fast, compact assembly language is that code isn't "portable"; source code for programs can't be transferred from one machine or system to another. Since OMEn runs the SAME software on all machines, this will no longer be an issue.
* * * * *
3) Poised for the future: Although OMEn is a 680x0 based system, it is possible to write I/O managers (as well as applications) in the language of any new RISC chip: Pentium, Power PC or Alpha IPX. It is intended to create cross-assemblers which will take Eazy Asm 68K source code and render RISC machine code for these systems instead of 680x0 code. This will generate full-speed drivers without source code changes.
In addition, these new systems are capable of running 680x0 software by emulation. Other systems which have both a 680x0 and a RISC chip or a DSP can off-load I/O managers onto the non-680x0 while the applications' instructions are executed on the 680x0 to yield OMEn multi-processor systems of "blinding" speed.

And although new RISC systems are in the news, older machines still form much of the software market. It will likely take some time for the new models to become a major share of a computer market which is already somewhat saturated.

System Tidbits

Working With Bitmapped Pictures

The "_ConvertBitmap" system call converts bitmapped pictures between different numbers of colours and scales them to arbitrary sizes. Printer managers use "_ConvertBitmap" to generate an appropriate image from a picture that they couldn't otherwise print properly. The Colour Dot Matrix Printer protocol converts colour pictures to 16 colours at 80 by 72 DPI, using slight patterning for three of the colours. (People who see the pictures often think that they are colour inkjet printouts.) The first version "Laserjet" protocol converts all pictures to black & white, 300 DPI. The next version is to have a patterned gray scale at 150 or 100 DPI for colour pictures. Currently there are no dithering options when converting bitmaps to a lesser number of colours. The 16 colour palette was mathematically designed. It does quite a presentable rendition of many 256 colour pictures. The four colour palette often does a fair monochrome showing of colour pictures as well.

In addition, the "upward compatible colour palette" system allows four colour (four shade) bitmaps to display on a 16 or 256 colour device, and 16 colour pictures to show properly on a 256 colour palette. Two colour images can be shown on any display or printer in any available colours. A coming version of OMEn will handle true colour.

GEM/DOS Disks With OMEn

OMEn's DOS Disk File protocol uses any GEM or DOS partition on a hard drive and any GEM or DOS format of 3-1/2 or 5-1/4 inch floppy disk on any machine including Macintosh.
Fourteen character file names, four character file extensions, and file version numbers are permitted by making use of the ten unused bytes (!) in a DOS file entry. Upper and lower case names are allowed.
If an OMEn file is copied or viewed from GEM or DOS, the extra information simply disappears and the remaining file name becomes upper case. Two minor compatibility problems occur: (A) when shortening the file name to eight characters causes a duplicate file name, and (B) some systems can't read lower case names (e.g. Falcon). Both problems are easily remedied by renaming the required file from OMEn and are minor beside the benefits.
The OMEn system itself defines file names up to 47 characters plus additional file information, which is optionally saved to GEM/DOS disks within the file itself.

Industrial/Home/Office/Shop/Lab Control

It is intended that OMEn be an excellent system for controlling things. An OMEn control system could run HVAC (Heating, Ventilation and Air Conditioning) equipment, fire alarms, security, lighting, school bells and synchronized clocks.
A PC card with its own power and battery backup are planned for the future to provide high reliability, round the clock control for homes, schools, offices, labs and factories. Another company in Victoria is considering using OMEn in a proprietary MC68332 based control system.
Graphical interface software to set up controls will allow any computer literate person to program and schedule these systems. This means the control system can be mass-marketed instead of being sold mainly to trained installers who are able to program in if-then-else BASIC like languages as is the case with current systems.

This is the last letters that have been posted on GEnie so far....

I will try and get the Demo uploaded on A.A...

Systems Solutions are selling them for 30 quid (20MHz chips).

Some ray tracers can use it. Also, any programs for which you have the
source can of course be recompiled to use it.

>which is good, because, on a technical level, I still do not like Postscript.
For fuck's sake, Tim. He asked about PostScript support, so that's what
I told him about. It's not that difficult for you to understand, surely?

We know you don't like PostScript, because you've told us so many times.
We know that I do like it, because I have said to many times. Neither
of these statements is relevent to the original post or to me answer.

If someone asks "How do I import my EPS files", an answer of "PostScript
fonts are inferior to Calamus ones" is not very helpful. It's bollocks
anyway, because according to previous mail and postings you compare PD
PostScript Type 1 with commercial CFN.

373. DeskJet 520 compatibility? (Summary)

Newsgroup: comp.sys.atari.st
Date: 1994-07-07 12:53:32 UTC
From: cordes@ac.dal.ca
Message-ID: <1994Jul7.095332.25464@dal1>
Source record: 184021

Some time ago I posted a query about the compatibility of older DeskJet 500 drivers with the new DJ520 printer. I wish to thank several folks who posted responses here and also one person who responded by email.

It appears that the consensus is that the older drivers should work fine, except that presumably they will not access the 600 x 300 dpi capability of the DJ520. What does not yet seem entirely clear is whether a _new_ driver (dj520 specific) can print graphics on the dj520 at 600 x 300, or whether it is only 'internal' fonts which can be printed at the enhanced resolution.

For myself, I don't think I'll worry overly about the 600 x 300 resolution; I now have to figure out how to get some gdos fonts to go with the dj5.sys gdos driver from the fontgdos package. [I don't actually have a dj520 but am seriously thinking of ordering one]. Maybe it would be better to buy SpeedoGDOS?

Thanks again for your input.

John

: Hi,

: I am hoping that someone can help me with this problem; I want to add
: items to an existing object tree. For example, I load the resource file
: into memory using rsrc_load() and then decide that I want to add twenty
: icons to the first tree.

Hallo Michel,

obj_add does only establish the references between the objects in a tree,
i.e. references from the desired parent object to the added child object
and from and to the sister objects. The record/data of the object to be
added must already be available in the object array. In your case,
after loading an object tree from a resource file you have to allocate a
buffer which is big ennough to contain the object tree and the objects
you want to add. Then you have to copy the object tree and now you can
add an object which is not already in the tree as long as the provided
object index identifies an object which can be located in the allocated
buffer. You need not to initialize the object before objc_add, this can
also be dawn afterwards.

Hope I could help,
Greetings Reiner Plaum.

377. New Version of MasterBrowse...v4.5a

Newsgroup: comp.sys.atari.st
Date: 1994-07-07 15:48:26 UTC
From: vctec@westminster.ac.uk
Message-ID: <CsKuFu.55D@westminster.ac.uk>
Source record: 184026

A new version of MasterBrowse is now available....Version 4.5a
This version fixes a couple of bugs in version 4.5

Download and enjoy.
Danny
HENSA/micros Atari moderator

Site: micros.hensa.ac.uk
Access: ftp, gopher, telnet, WWW, Lynx
Directory: micros/atari/tos/n/n114
Date mounted/updated: 07/07/94
File names: mb45abin.lzh

Description:

MasterBrowse is a GEM text file viewer, packed with features. For a
complete list, see the documentation inside the archive, or see descriptions
to previous versions on the archive.

See the documentation for an extensive list of bug fixes, and new features.

MasterBrowse 4.5a July 4, 1994 (w\ Installation program V.4.5a)

BUG FIX: The file selector should not work correctly (again).

BUG FIX: AutoSave Options will now always save the options to the
path pointed to by MB_CONFIG.

* Version 4.5 June 29, 1994 (w\ Installation Program V.4.5)

NEW FEATURE: MasterBrowse now has even more powerful windowed dialog box
editing capabilities. The following keys can be used inside
a windowed dialog box:

UNDO = Exit (Cancel)
Return = Exit (Done)
TAB = Next Editable Field
Control + TAB = Previous Editable Field
Shift + Left Arrow = Start Of Editable Field
Shift + Right Arrow = End Of Editable Field
Shift + Up Arrow = First Editable Field
Shift + Down Arrow = Last Editable Field
Control + Left Arrow = Start Of Previous Word
Control + Right Arrow = Start Of Next Word
Shift + Backspace = Delete From Start Of Field
Shift + Delete = Delete To End Of Field
Alternate + [UNDERLINED LETTER] = This will exit the dialog
box as if you had clicked on

the button containing the
underlined letter.

NEW FEATURE: MasterBrowse now has context sensitive online help, if you
use the ST-Guide accessory. If the accessory is installed
on your system, pressing the Shift + HELP key will cause
MasterBrowse to instruct ST-Guide to open a window with
information relavent to your current position. Since all
of the information is external, this option does not affect
the size of MasterBrowse at all, or how much memory it
uses. The entire MasterBrowse manual is available (accessed
by entering the help system while you are NOT in a dialog
box).

NEW FEATURE: When marking a block, the SHIFT key can be used to "continue"
a previously marked block. This means that the start of the
block will remain the same, and you are only adjusting where
it ends.

NEW FEATURE: MasterBrowse now has an "Edit" menu; "Clip Block" is now
"Copy" and "Open Clipboard" is now "Paste". This change
was implemented so that MasterBrowse would be more compliant
with existing (and future) standards.

NEW FEATURE: MasterBrowse now has a "Delete" option under the "Edit"
menu; it will delete the SCRAP.TXT file inside the
clipboard folder.

NEW FEATURE: The keyboard shortcut manager has been completely rewritten;
you can now add and remove keypresses at will, and change the
keyboard shortcut for ANY action (not just menu entries).
MasterBrowse no longer makes any distinction between the
left shift key and the right shift key. The interface to
the keyboard shortcut manager has also been rewritten; it is
now much more user-friendly!

BUG FIX: Selecting "Skip" in the colour configuration dialog box will
no longer cause MasterBrowse to set that colour to white.

BUG FIX: If the text or background colour is chnged, the window affected
is now completely redrawn.

NEW FEATURE: MasterBrowse now has a push/pop position feature; this can be
thought of as a temporary bookmark. You "push" (set) the
position, then "pop" (unset and move to) the position. This
is much faster than setting a bookmark because it does not
cause a dialog box to appear on the screen.

: can't get Llamatron to work on my Falcon with Backward. There
: is no option of STE emulation as far as I can tell which I'm told
: I need.

: Which ST emulator do I need to get Llamatron to work on my Falcon.

The STE emulation is the sound mode. I got it to work with Backward
2.52 on my Falcon TOS 4.04 but it's too fast to be playable. I tried
switching the clock frequency to 8 MHz and switching off the caches but
then the movements are not smooth. (all the sprites jump around instead
of move)

Maybe there is some combination of MHz and caches that works.

>that will do it! :(

Yes, a given application can do it for itself: Calamus SL will do so, even
on a 520ST+.
But one cannot do a transparent virtual memory manager on operating system
level without a PMMU and thus a 68030.

bye, Peter
```

Did Warner repurchase Atari Coin-Op or some such? Last I had heard, Namco purchased Atari from Warner, and then Namco sold Atari to an investment group of some sort.

Later,
Gizmo

I don't think so. Plus correction IBM manufacturing is North Carolina.
A few things stand out, One Atari is now letting Falcon to 3rd party
developement.

Also, loke at the fact a third party is soon to produce a Jaguar card for the
PC platform.

They are searching for third parties to develope the TT030 platform also.
This perpahs is due to low funds on their part, but if I had to say I won't
produce additional machines and had a machine that was rooted in the business
world of Europe. I would still produce through other sources then I could say
I did not go back on my agreement I am not producing these machines myself.

Last, but the most important, IBM was showing of the Jaguar at a trade show
that Atari could not attend last year.
But, where are the Jaguars. I know IBM can do high volume production.
So, why is IBM dragging their feet?
They got the Pentium produced and out on shedule.

It just doesn't add up to me. What is the verdict on the Net???????

I use a TT030 with a ZyXel U-1996E Plus, it is 19,200 baud, and can compress the data for DTE through put of up to 76,800 bps.

I use STalker and use the number 2 modem port. With a modem cable that has hardware flow control. You will not need to use any serial fix program but you will have to expand the buffers when sending at 9600 baud and up.

The a serial patch program is included with STalker for use of the number 1 modem port.

Len:

First, I'm far from stupid! :) Second, I've been involved with the REAL world and have been involved with commercial Atari software development. Drawing on that experience, I can tell you that these companies don't write games for a particular platform out of love. They do so only because they feel it will be profitable. Developing big name software is extremely expensive and most developers in today's competative market can't afford to make an investment in a technology that is neither proven or very profitable at this point in time.

I do agree with you that wooing the big name developers is one of the big keys to the Jag's success - but it's gonna take a lot more than a letter writting campaign and corporate promises to bring them into our camp.

Now, coming back to the stupid part - Electronic Art's games, Len? C'mon! Have you forgotten that Trip Hawkins, founder and current CEO of EA has a vested interest in 3DO?

Ok, granted, perhaps I did stray from the topic a bit - but the gist of my message was the same - Letter Writting Campaigns for this industry and market are a waste of time. Save your stamps for activities where such things are more effective like saving the whales and the O-Zone layer, etc.

Just one correction to Scott's post:

Scott, Atari has only $35 million available to run the whole show - not just for marketing! It is because of this that Dorfmans of the world have condemed them to death. If they are lucky, they might have $1-2 million to spend on advertising...

Ari

>point in time.

Ari, first of all. I would love to know which company you were involved in
that produced Atari software. I'd like a name.

Secondly, I know for a fact that a lot of companies are influenced by
letters. They see letters from consumers that want a product and they use
this to determine there is a demand for a product.

>
>I do agree with you that wooing the big name developers is one of the big
>keys to the Jag's success - but it's gonna take a lot more than a letter
>writting campaign and corporate promises to bring them into our camp.

I'd like to know WHAT will it take to get big name developers. A couple of
years ago, Sega was in the same situation as Atari. They needed to get
big name developers and they did. These companies took a chance by developing
for the Genesis. A big chance. If the Genesis failed, these companies
would feel the heat from Nintendo.

Sega persuaded these companies to take a chance. Atari Corp. can persuade
the same companies to take a chance with the Jaguar.

And I'm getting this strange feeling that you think this letter writing
campaign might work. And you are worried about it.

>
>Now, coming back to the stupid part - Electronic Art's games, Len? C'mon!
>Have you forgotten that Trip Hawkins, founder and current CEO of EA has

>a vested interest in 3DO?

Have you forgotten that Trip Hawkins resigned as the CEO of Electronic Arts
due to conflicting interests?

Or did you just not know that?

Did you not know that Electronic Arts is not making any more new titles for
3DO until the system shows improvement in sales?

>
>Ok, granted, perhaps I did stray from the topic a bit - but the gist of my
>message was the same - Letter Writting Campaigns for this industry and
>market are a waste of time. Save your stamps for activities where such things
>are more effective like saving the whales and the O-Zone layer, etc.

Ari... it is my belief that you are more interested in seeing Atari and
its products fail than succeed. I believe this because a writing campaign
can only help. And for you to try to convince people that it is a waste
of time makes me wonder if you have any stock in 3DO.

You also point out that Atari probably can only afford $1 million to $2 million
in advertisements. This sounds like someone who is anti-Atari.

Folks, if you want to see Jaguar succeed, participate in these writing
campaigns. I not only have a degree in Business, but I also have plenty
of business experience. Letters work. If someone tells you any differently,
try to figure out why they are trying to tell you differently.

Len

Ask your system staff to install Mtools. It will read/write standard DOS
formatted disks. Of course, the ST can use these disks with no problems,
given a DSDD drive. If you want to format some disks on your ST for DOS
use, I suggest ps2form.tos, available from atari.archive.umich.edu.

406. Running MULTI-BRIQUES on Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-07-08 05:10:04 UTC
From: sammcgee@crl.com
Message-ID: <2vin3c$lit@crl5.crl.com>
Source record: 183901

I found this very large Falcon game at a.a.u.e. I can get past the
title screen by pressing the SHIFT key, then I'm lost. Any French readers
out there care to translate some of the LISEZ.MOI? (Read me?)

-- MULTI-BRIQUES Version 1.00 --

Voici la Dmo de la Version 1.00 de MULTI-BRIQUES.

ATTENTION, ce logiciel ne fonctionne que sur FALCON 030

Les quelques "flash" que vous pourrez voir l'cran durant le
jeu, ne se produisent que sur cran VGA avec TOS 4.02 (bug!) et
sont "patchs" dans la version complte.

COMMENT JOUER?

Lancez MULTI-BRIQUES en double-cliquant sur l'icne MULTI.TOS
Au bout de quelques instants vous arrivez sur l'cran de menu
pour choisir le nombre de joueurs et les commandes pour ceux-ci.

Vous pouvez jouer 4 avec le choix parmi 6 commandes:
JOY 1 joystick sur le port 1 (droite sous le clavier)
JOY 2 joystick sur le port 2 (droite sous le clavier)
JOY A joypad sur le port A (gauche du clavier)
JOY B joypad sur le port B (gauche du clavier)
CLAVIER1 touches flchs du clavier et SHIFT droit pour "feu"
CLAVIER2 touches E, X, S et F ainsi que SHIFT gauche pour "feu"

Sur l'cran de menu, vous ne pouvez faire votre choix qu'en
utilisant le CLAVIER1 et donc SHIFT droit pour commencer la
partie.

Vous pouvez faire "PAUSE" en utilisant la touche "P" ou le bouton
"PAUSE" des joypads. Vous pouvez quitter avec le bouton "Q" ou le
bouton "OPTION" des joypads.

Note: Le temps assez long qui s'coule au chargement est tout
fait normal: les images telles que celles de MULTI-BRIQUES sont
trs difficiles compresser et le temps ncessaire au
dcompactage est assez long (environ 5 secondes).

Thanks,
Sam

You only have to produce a MSDOS compatible 720K disk. I have done this with the mtools package (from GNU, taken from prep.ai.mit.edu or some mirrors) under SunOs4.1.X or directly with the PCFS and vold under Solaris 2.X.

The Atari understands DOS Format, but produces its own slightly differing disk format untit TOS 1.4, I think. So you should format on the SUN machine.

I hope that helps.

>ideas?
>Has anyone had trouble with Storm appearing to use 999 columns at the host?
>If so, were you able to fix it from the Storm end as opposed to the host?
>Any advice appreciated.

Hi Glenn,

As far as the first question, I decided to get rid of the Storm xyz
protocols and use XYZ.TTP instead. To facilitate this, I wrote a basic
program that I tied to alt-t. The program pops up with a choice of using
XYZ or Storm protocols, then if XYZ is chosen, it unloads the Storm
protocols. I did this since Storm has auto zmodem (I almost never have
the storm ones installed). Fromt here, it's a real simple shell for
XYZ. Once the transfer is done, I have a alert box asking if you want
the Storm protocols reloaded (If you select Storm at the first alert box,
it loads the xymodem and zmodem modules--if they weren't already loaded.)
It's pretty simple to write; but if you want it, email me...

I don't understand your second question....

Bye for now,
Matt <mattk@netcom.com>

: You only have to produce a MSDOS compatible 720K disk. I have done this
: with the mtools package (from GNU, taken from prep.ai.mit.edu or some
: mirrors) under SunOs4.1.X or directly with the PCFS and vold under
: Solaris 2.X.

: The Atari understands DOS Format, but produces its own slightly differing
: disk format untit TOS 1.4, I think. So you should format on the SUN machine.

Sorry, I must have missed this posting first time round....

Yes, as Wolfram, and Mickey have pointed out, you need Mtools for the
Sun, which will allow you to read/write from/to DOS format disks.

you just
mcopy a:\filename_on_floppy filename_on_sun

or

mcopy filename_on_sun filename_on_floppy

As mentioned above...you may format your disk using mtools...but this I
personally find to be a bit of a pain...inputting the number os tracks
sectors etc. I would format on a DOS machine first, as old STs
recognise this. However, if you've got TOS 1.4 onwards, then you masy
format on the ST, and this is more compatible with DOS format.

Really? First I've heard. Only last night Sys Solutions were saying they wanted
to compare the GE-soft machine to the Medusa to decide which one to buy for their
Atari DTP bureau. (Upgrading the TTs :-) )

You could try setting AE_PNTSIZE to a smaller value (possibly 7?) in
gem.cnf to see if MTOS AES 4.0 can do it.

I don't think NVDI on its own will allow you to change this, though.

Source record: 183914
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

***** PHOTOCROME 4 *****

I have just had a look at this Patch for Photocrome 4,
so that is can run at 16mhz on a Mega STE..

This is the command that is wrong.. cmp.l #00020010,0004(a0)

First the software looks for the Machine Type Cookie _MCH
then at the cookie machine type flag bits....

00020010
^ = STE
^ = TT

00010010
^ = Mega STE

So this patch is simple, some one just got the machine type flag bits wrong.

I don't know if its posible to patch it for the ADspeed, but I do intend to
give it a try.....

P.S. After loading Photocrome into the Raid Debuger, I did a search for the
00020010 string, there was only one occurence...

Hope this helps.....

From: whitema@rtsg.mot.com
Message-ID: <2vjdgr$g6a@delphinium.cig.mot.com>
Source record: 183924

Has anyone out there used MicroRTX? I picked this up off of an archive a few months ago, and just looked at it last night. Kind of reminds me of VRTX or some of the proprietary stuff here at work, which I can program in better than Unix (which really isn't saying a lot). It's a real-time multitasking operating system.

If you've used it, is it pretty stable? What sort of application did you use it for? Did you register it (come on, be honest :))? Did you ever use the tech support for it? Does the company still support it (I forgot the name)?

It seems to start up OK on a 1040 STe with 2.06, but I haven't had a chance to make anything that uses it yet. Looks interesting, though.

Thanks,
Michael

>Gopher or WWW clients for the Atari?

Yes, I ported the terminal-based WWW browser Lynx to the Atari. However, to
use it you'll need:
- MiNT, preferably a patched version 1.10
- Enough memory. This probably means 4 Mb.
- If you want to connect to the Internet you also need Mint-Net.

It might be a lot easier to run Lynx on your remote host, that way you don't
need any extra's on your ST. You can try Lynx by telnetting to
www.twi.tudelft.nl and logging in as "lynx".

424. More Atari Newsgroups !?

Newsgroup: comp.sys.atari.st
Date: 1994-07-08 11:38:05 UTC
From: tj@aiscube.AIS-dortmund.de
Message-ID: <2vjdqt$p8p@aiscube.AIS-Dortmund.DE>
Source record: 183916
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello Atari-World

Although there has been some disussion about more Atari-related Newsgroups
in te Usenet lately, it seems that most activities concerning this Idea
are obviously lost. Anyway, any time i look at the comp.sys.* or comp.os.*
areas i sometimes feel a little unsatisfied with just three or four
Atari-Groups, while IBM'ers and Amigos/Amigas can read and write in a lot
of "Special-groups" related to their machines. What is it, that all
Atarian's in the Usenet use such a relatively small space to communicate ?
Is it that most of us are satisfied with our small area here, or is it
the work which has to be done for creating a new group ?
Don't get me wrong, it's not the idea of "if IBM'ers and others have the
right to have such a lot of Groups, we do also !". But meanwhile, i believe
there are some good reasons to have more Atari-Groups. Except the work
of CFD/CFV and so on, which has to be done, i cannot see any disadvantage
in having more groups, but maybe i'm wrong ?! it's just my personal opinion.
For that reason, here is an idea of what COULD be done:

(Note: it's just my personal idea, perhaps someone has a better solution)

Following Groups:

1) comp.sys.atari.st /* already there ! */
2) comp.sys.atari.st.tech /* already there ! */
3) comp.sys.atari.st.advovacy /* already there ! */
4) comp.sys.atari.st.hardware /* Hardware related topics */
5) comp.sys.atari.st.software /* Software related topics */
6) comp.sys.atari.st.programming /* Programming the Atari's */
7) comp.sys.atari.st.mtask /* All about MiNT/MTOS/Mag!X/Geneva */
8) comp.sys.atari.st.games /* Games and Fun */

Although (1) should still be ok for non-technical disussions, (2) is a litle
bit difficult to "insert", because everything could now (and better) be
directed to (3) - (8).

Well, Atarian's, what do you think ? Is it worth to think/talk about or
do you think i'm totally crazy ? :-)

The version number of bin is independant of the inc and lib.
The last two must be of the same version.

Getting the latest versions of all three should satisfy these restrictions.

Just a quick question to ask if anyone knows if any extra levels were released for this game. Apparently they were going to do some, but I don't know whether it sold well enough to be worth their while.

Failing that, does anyone know of any similar styles of game which are hopefully a bit more challenging? Preferably wioth slightly more intelligent opponents, although that might be asking a bit much of a poor ST. :)

ALL graphics on the new DeskJets is limited to 300x300 -- ONLY
internal/cartridge/soft-loaded fonts (in BLACK TEXT) are printed
at 600x300.

If you're using AtariWorks (or other GDOS/SpeedoGDOS application),
PageStream, Calamus, etc., you're still only going to get 300x300
resolution no matter what. If you just send text to the printer
(like printing a text file from the desktop or a plain word
processor like WordWriter), the you will get 600x300 (using
whatever font the printer's configured to use).

From: rehrauer@apollo.hp.com
Message-ID: <CsMICq.IF4@apollo.hp.com>
Source record: 183929

My son has recently "discovered" my good old 1040ST, or should I say Dungeon Master. Naturally I cannot find all my carefully scribbled notes of spells, etc from when I completed the game back when. I've looked at atari.archive.umich.edu, but much of what's there appears to be in various Atari compressed formats (".arc" and ".tny" files; hmmm, those sound vaguely familiar... :).

Since I've no connection between my Unix node here at work and my ST at home, could someone please either point me at a Unix tool that groks these formats (ha!), or at an ftp site that contains these in a raw text form? (Or if someone is willing to just mail me this stuff, that'd be great too!) The files I'm interested in are the results of unzoo'ing /atari/Games/dm_hints.zoo (such as the dml*.tny and dmspell*.tny files), and/or (I don't really know whether the contents are redundant) /atari/Games/dm*.arc files.

Thanks!

My french is fairly rusty, but I have played the game so I can give poor
interpretation that should work.

> -- MULTI-BRIQUES Version 1.00 --

>Voici la Dmo de la Version 1.00 de MULTI-BRIQUES.

Here is the demo of version 1 of Multi-Bricks

>ATTENTION, ce logiciel ne fonctionne que sur FALCON 030

>Les quelques "flash" que vous pourrez voir l'cran durant le
>jeu, ne se produisent que sur cran VGA avec TOS 4.02 (bug!) et
>sont "patchs" dans la version complte.

There is a bug with this program when you are using a Falcon with TOS 4.02
on a VGA monitor. This will be patched in the final version. (I believe they
are saying that it causes the monitor to flash).

>COMMENT JOUER?

About the Game?

>Lancez MULTI-BRIQUES en double-cliquant sur l'icne MULTI.TOS

Double click on the file MULTI.TOS to start the program.

>Au bout de quelques instants vous arrivez sur l'cran de menu
>pour choisir le nombre de joueurs et les commandes pour ceux-ci.

You then will see a menu, where you will select the number of players
(joueurs) and the input device they will use. (joystick,keyboard, etc)

>Vous pouvez jouer 4 avec le choix parmi 6 commandes:

You can have 4 players with the choice of 6 different input devices.

>JOY 1 joystick sur le port 1 (droite sous le clavier)

JOY 1 joystick in port 1 (right of the keyboard)

>JOY 2 joystick sur le port 2 (droite sous le clavier)

JOY 2 joystick in port 2 (right of the keyboard)

>JOY A joypad sur le port A (gauche du clavier)

JOY A Jaguar controler in port A (left of keyboard)

>JOY B joypad sur le port B (gauche du clavier)

JOY B Jaguar controler in port B (left of keyboard)

>CLAVIER1 touches flchs du clavier et SHIFT droit pour "feu"

Keyboard 1 use right shift for fire (I'm not which keys for movement
probably arrow keys)

>CLAVIER2 touches E, X, S et F ainsi que SHIFT gauche pour "feu"

Keyboard 2 use E,X,S and F to move and left SHIFT for fire.

>Sur l'cran de menu, vous ne pouvez faire votre choix qu'en
>utilisant le CLAVIER1 et donc SHIFT droit pour commencer la
>partie.

If you don't know what to choose use Keyboard 1 and press the right shift
button to start the play.

>Vous pouvez faire "PAUSE" en utilisant la touche "P" ou le bouton
>"PAUSE" des joypads. Vous pouvez quitter avec le bouton "Q" ou le
>bouton "OPTION" des joypads.

If you want to "PAUSE" press the "P" key or the "PAUSE" button on the jag
controller. You can choose to quit with the button "Q" or the button "OPTION"
on the jag controller.

>Note: Le temps assez long qui s'coule au chargement est tout
>fait normal: les images telles que celles de MULTI-BRIQUES sont
>trs difficiles compresser et le temps ncessaire au
>dcompactage est assez long (environ 5 secondes).

Note: It takes a rather long time between screen displays as the graphics
used in MULTI-BRIQUES are large and very hard to compress. So expect it to
take some time to decompress (around 5 seconds).

>--

>Thanks,
> Sam

>sammcgee@crl.com
> or
>s.mcgee2@genie.geis.com

Your welcome. I hope this helped. I don't recommend using a normal
joystick for this game. I prefer to use a jag controller or the keyboard.

Check out the TCPIP.FAQ at a.a.u.e. It lists the majority of options available. I try to email everyone that asks about this, but recently most of the time my University can't find your HOST.

For those of you who are wondering, the TCPIP.FAQ convers topics of SLIP,PPP and UUCP as well as some more general information about networking and internet.

This DOES work!

I have a MSTE and used Michtron Utilities to search for "00020010".
Just one occurrence. I changed it to "00010010". It now does all its
"work" in 16MHz and then switches automatically to 8MHz to display the
pictures! Do it!

>
>

That's because Gemulator is a commercial product that you buy from
your local Atari dealer. It's $99 here in the U.S. and available from
dealers like Toad Computers. In New Zeland your best bet is to
call Paragon Computers in Perth Australia at +61 9 221 3216 and they
can sell it to you along with U.K. TOS ROMs that you use down there.
Or email me if you need more info or want to order it directly.

tj@aiscube.AIS-dortmund.de (Theo Janssen) writes:

>4) comp.sys.atari.st.hardware /* Hardware related topics */

I would vote for this, but wonder if you should tag it ST? I would
be greatly interested in any hardware hacks, projects, for my
Falcon, as well as an STe that I dont do a lot with...

>5) comp.sys.atari.st.software /* Software related topics */

Probably not so useful, since c.s.a.st would be the place where most people
would discuss this. If this exists, what would the 'root' c.s.a.st
contain?

>6) comp.sys.atari.st.programming /* Programming the Atari's */

Sure, I would love to learn to program my computer, considering the
lack of (new) books that are on the general market for the ST.

>7) comp.sys.atari.st.mtask /* All about MiNT/MTOS/Mag!X/Geneva */

dunno if this one is a good idear, but cant see any reason why not. Might
want to see if the 680x0 (Atari-Specific) peoples working on the Falcon/TT
Linux would like this, as I wouldnt mind seeing my Falcon running
Linux...

>8) comp.sys.atari.st.games /* Games and Fun */

indifferent...

>Well, Atarian's, what do you think ? Is it worth to think/talk about or
>do you think i'm totally crazy ? :-)

shrug I think the topics come up before, but not too many people have
expressed interest. If you do a formal CFV or CFD, make sure you cross-post
into this newsgroup, otherwise you might miss out on some votes.

MAPLE 4.2 was the last version released for the Atari - I can
get it for myself at my university (Waterloo) for an $85 site
licence fee (since I'm a student). I haven't bothered because
it doesn't support the FPU on my TT and I have access to XMAPLE
5 on my accounts at school - MAPLE for the atari is old and
slow compared to most platforms - I don't think it would
be worth having. I do use Mac MAPLE with Spectre and it's OK
but for serious stuff I end up logging in to a Unix system.

Source record: 183941

>:] all.
>Nothing can scroll as fast as version 1.91 either.
>

That is incorrect. ANSITERM doesn't run on /dev/fasttext or a vconsole.
Anything that does will use hardware scrolling (needs an STe, or at least
a machine with something less than a 256 byte video boundary!) and I've
clocked text output to the screen at well over 7000cps just using fwrite
on a line by line basis. If you write more than a line at once, then it
only gets FASTER. And scrolling is instantaneous. Text output is slowed
by the 16Mhz processor drawing 16 bytes/char - not by screen scroll!

>: For ease-of-use, speed, and net-compatibility, don't look any further
>: than Uniterm or Flash (Not Flash-2 which is very slow, and quite buggy!).

The only program I found to have flawless vt100 was Connect. In fact,
the only differences between Connect and my [d][i][g][i][t][a][l] VT-240
terminal (provides vt52, vt100, vt220, and tektronics 4014) was that
Connect was faster, provided vt102/ANSI, was more configurable, and used
extensions on the vt52 for color (like ATARI does). However, I simply
uploaded my own termcap file and set TERM and TERMCAP appropriately,
so I get stv52 (virtual console extensions) to vt52 on the local Linux site.
The sysvr3 site I'm on now won't recognize TERMCAP and the sysadmin won't
append my termcap entries, so I use plain vt52. I have never needed vt100
yet!

>

>: can be set-up to happen with a single keypress!
>
>ANSITerm uses Alan Hamilton's XYZ program to so transfers, and it handles it
>quite well.
>

And that program is horrible. It is too low level. A file transfer doesn't
need super-visor mode, and I see no reason why it has to be so hardware
dependant. The REAL sz and rz can run over a pipe if you want them too!

Personally, I would love to see more Atari Specific groups... Even though I rarely ever post to the c.s.a.st groups, I do read them regularly (though our news feed seems about a week behind -- at least.) One thing I notice is that there is a lot of needless cross-posting now. What will happen with additional groups? One way to help might be to not include ...hardware, ...software, and ...tech. Either leaving ..tech for both hardware and software or spliting it into the hard and soft groups might be better.

But anyway.... I think the addition of more specific groups may even help foster more productivity in the Atari world since more specific info would be exchanged in each group.

I say go for it! With the Jaguar comming into the mainstream, Atari is comming back into the public eye. Let's let the world no that Atari also makes some terrific computers as well.

>
>Ta,
>
>brian@mel.dit.csiro.au
>sonical@zikzak.apana.org.au

You only have to produce a MSDOS compatible 720K disk. I have done this
with the mtools package (from GNU, taken from prep.ai.mit.edu or some
mirrors) under SunOs4.1.X or directly with the PCFS and vold under
Solaris 2.X.

The Atari understands DOS Format, but produces its own slightly differing
disk format untit TOS 1.4, I think. So you should format on the SUN machine.

One little problem here though. I have done exactly the same. MS-DOS format disk
from SUN/IPC to ST. One problem I had was that the SUN constantly ignored FAT 2
on the disk, while that was all that my ST cared about. So I wound up with files
that, when copied to another disk (HD or floppy), consisted of the original files
first sector duplicated until the filelength was correct. Not very useful I'm afraid.

This happens with both TOS 1.2 and 2.06, but I can at least format useful disks
with 2.06. TOS >= 1.4 should work that I know of.

Solution for the FAT problem then? Only one so far. Knife ST. Superb pice of code.
With that one you can copy the correct FAT1 to the empty FAT2 and then everything
should work as usual.

Happy ftp-ing

Date: 1994-07-08 20:29:17 UTC
From: stevedc@ac.dal.ca
Message-ID: <1994Jul8.172917.25498@dal1>
Source record: 183944

Well, I have not much of a current opinion of MORPH882.ZIP
which I got from Lexicor section while FTPing! Once again
all I can say about the demo is that bombs look pretty
common, although it would be nice to see the bombs morph
into apples or something.....<grin>:-) Seriously, Yat if
you see this here, what's wrong on my end? My current setup
is MSTE, 4Megs TOS 2.06 no FPU. HELP!! I put the files
on a blank floppy and booted, and still nothin'! It states
in the docs that it should run? Puzzled....Steve.

Just a note, Maple is NOT MathCad... I can't remember the email address
for Maple Software (at University of Waterloo, Waterloo, Canada), but it
should be easy to trace down using netfind, or simply by posting in
sci.math.symbolic...

And indeed, there is a version for the Atari, although I don't think they
ported the current one. There is no student version though (based on
feedback from last year), so you'd have to put the full amount in it.

>GDOS on 1MB ST and ancient TOS? Possible? What do I need, where do I
>get it? Also any Microsoft Word type word processors? First word
>sucks. Help me before I buy a Mac. Thanks.

Sure. Most programs that use GDOS include a copy on the distribution disks. You can also get a PD version from Germany called AMCGDOS (I think...). Better yet, go with G+Plus from Codehead, which is faster and can be setup to load different configuration (ASSIGN.SYS) files for each program; GDOS requires you put the correct ASSIGN.SYS file in the root directory and reboot. Or, as many people have pointed out, try NVDI, which includes GDOS and speeds up all screen activity by several hundred percent. I don't think NVDI is configurable like G+Plus is, though, which is just too bad; GDOS shouldn't require a reboot everytime you want to switch between GDOS programs.

The wordprocessor I have used and love is WordUp v3.0 from Neocept. They went out of bussiness a couple years ago, but WordUp gives you multiple files, columns, fonts, endnotes, and has an excellent (really the best) dictionary, in addition to lots of other features (graphics import, etc.). You should be able to pick up a used version if you keep your eyes open, and post some "wanted adds" here and on other online services you frequent. I have used it on a 1040STfm w/1Mb RAM and DSDD floppy drive for several years and never run into a problem.

Well, except for printing; WordUp doesn't like my KX-P1180 printer much. :-(However, lots of people still use it and love it. The best thing is that it will run off of a single disk, though GDOS printing and spell checking require you to switch disks once (dictionary and drivers are on separate disks).

No doubt you'll hear from lots of other people.
Bye,
Tom Hopper

Source record: 183854

Hi there,

Quite a few people (as always) have been replying on this question and
(again as always) there is quite a divergence of opinion.

One program that I havn't seen anyone ever mention is called Starcall.
Firstly the big drawback is that it is all in German, but if you get
past that (and it doesn't seem to difficult to figure out), it is
quite a useful program. It has both a text style scrren like Uniterm
and also a GEM screen like Connect. If you register it, there is also
a level of fax support as well.

If you like the look of Connect but find that it is too large for your
memory or that you don't want to use a GEM screen, it may be worth
looking at.

Cheers,
John

Well, basically because I aquired the 4Mb ram board free and SIMM's cost
me...

As it happens, since I posted that, I got bored with it and fitted a
single 1Mb*36 72-pin SIMM, which I wired in as the full 4Mb.

Cheers, Martin.

Quite a number of the newer SVGA monitors will cope quite happily with
the ST hi-res output. I bought one labelled Trust for the PC here and it
got moved to the Mega when I upped that to an SVGA colour one.

Do the overscan mod too - you'll really get the benefit then (I get
"silly" resolutions in med-res on my RGB multi-standard Salora TV, like
around 864x384).

Cheers, Martin.

Ooohh, now you're asking. I'm not a "C" programmer at all but you'll
need some detailed data on your pocket ethernet adapter before you can
mod the source for it.

Armed with the data, it shouldn't be too difficult to do, especially if
you can find a good "C" programmer to help.

The energised ball multiplies any bonus scored while it's active by a further factor of x4, so if you already have the multipliyers in the bottom screen at say x5, then any bonus will be x5 x4, that is x20 overall!

ICD are still updating the ProUtilities. My latest version is 6.5.5.
I believe the cost of updates is something like $10. Return your
disks with a check and they will send you out the update. On my last
update, they did hold off sending me the update since I was specifically
after the cd-rom drivers they were adding (new ones) so I had a wait of
about 2 months for the software to finally arrive. It was worth the
wait. I would guess by now there is potentially already a newer
version out than 6.5.5. Wayne

There is a few thing that people should know about the STORM's Zmodem
and XYZ.....

First the Zmodem in STORM supports the later Omens Zmodem that can use
wild cards, no other Zmodem can do this....

So you can dnload all the zip and lzh files in one go, like *.lzh *.zip..

Try that with any other Zmodem....

Also XYZ is very very slow and OLD, use GSZRZ228 instead, you will find
this is the fastest Zmodem there is for the Atari.....

Not needed, since rec.games.video.atari takes care of this (or should anyway)

TJ> Well, Atarian's, what do you think ? Is it worth to think/talk about
TJ> or do you think i'm totally crazy ? :-)

If so, you're about the 123rd crazy person (including me) who brought this
subject up so it must be worth talking about. :-) Trouble is to agree on
something and then go through the net buraucracy to create the new groups, and
there's no guarantee they'll pass the voting procedure.

It's perhaps worth noting that you didn't bring up all the existing groups. The
others are:

alt.atari.2600
alt.games.lynx
comp.binaries.atari.st
comp.sources.atari.st
comp.sys.atari.8bit
comp.sys.atari.announce
rec.games.video.atari (already mentioned this)

Hope I have all the names correct. If not, flame me. :-)

Interlink should work just fine for getting files from your system. I use Stalker but all it really boils down to is have a compatible transfer protocol. Our system supports XYZmodem at least. I know that Interlink can do Y-modem so unless your dial in system is really behind, I can't foresee any problem. On this system, I type sz (for send z-modem) and then the filename or wildcard *.lzh. I'm pretty sure it should just require sy filename.ext or something similar. Try typing man sy at your end and see what it says to you.

Len Stys <aa399@cleveland.Freenet.Edu> writes:

>Ari, first of all. I would love to know which company you were involved in
>that produced Atari software. I'd like a name.
>

Len, here's the name - MajicSoft. I was responsible for creating or enhancing most of the graphics for their productions. They are one of the last domestic ST game developers and unfortunately, due to EXTREMELY BAD management (yes, even worse than Atari's) they are now flurting with bankruptcy. Just for your info - some other Atari notables associated with this company include Dave Munsie (author of the GP_Edit Library, MAGE, Frogger, Kid-Kong, Evader, Dark Pearl, Kid-GP, Berserk, ST Invaders, etc.) and Robert Dytmire (author of Insectroid, Mrs. Munchie, Cudlee's Quest, and Megapede).

Granted, this company is hardly a MicroSoft, however, out of necessity for the reason mentioned above, I had to take on more responsiblities than graphics. My lousy experience there gave me a good insight into how commerical products are produced. I also know many developers on other platforms who have swapped stories and/or given crucial info to how products are produced and marketed on other machines, etc. And, I'm also a Marketing and Business/Econ major so I do have a pretty good understanding of how things work and why.

>years ago, Sega was in the same situation as Atari. They needed to get
>big name developers and they did. These companies took a chance by developing
>for the Genesis. A big chance. If the Genesis failed, these companies

It seems to be a chicken and egg thing w/the Jag and developers. They want to see hardware deliveries in the order that Atari has promised before committing scant resources and time on the system. Video Consoles are low ticket items and require sales in the millions while computers can be supported w/sales in the tens of thousands.

Oh, remember that SEGA had already made inroads into the marketplace w/their MASTER SYSTEM. And, you must realize that they both had and were willing to spend the money to promote the system and entice developers. Atari must be able to do both and spend more simply because the market is maturing and it is more competative.

>Ari... it is my belief that you are more interested in seeing Atari and
>its products fail than succeed. I believe this because a writing campaign
>can only help. And for you to try to convince people that it is a waste
>of time makes me wonder if you have any stock in 3DO.
>

Not at all Len! I've been an active Atari user since 1986 and up until very recently I had three Atari systems (a 520, 1040STe, & Falcon). Over the years, I bought the hardware, software and even developed for them for a while. However, I know an orphan computer when I see it and I had to get out.
I would like to see the Jag work but you're gonna have to accept the reality that Atari probably will never develop new PCs ever again - even if the Jag makes tons of $$$.

No - I don't own 3DO stock. I watch THDO's performance daily on my PRISM terminal at work and its garbage (its depreciated so much). But, then again so is ATC, at least for the time being.

Len - it's fun debating w/you but don't take things so seriously, ok?

Regards,

Ari

Rev. Dr. Freak (rappleye@felix.kodak.com) wrote:
: GDOS on 1MB ST and ancient TOS? Possible? What do I need, where do I
: get it?

If you want just GDOS, get AMCGDOS from atari.archive (free :-). If you want speed, buy NVDI. If you want a reliable system, get a newer TOS.

: Also any Microsoft Word type word processors? First word
: sucks.

Lots of them. Personally, I would recommend Tempus Word, but I'm afraid there is only a German version. TW is unrivaled in speed and offers about the same features as Microsoft Word on a Mac, but _much_ faster. Other people will tell you about their preferred software products :-)

: Help me before I buy a Mac. Thanks.

There are still reasons to buy Macs, e.g. the built-in networking capabilities and the much bigger variety of software. If you want to have always the latest version of your software I wouldn't stay with the Atari. If you want a hacker machine, buy a PC and run Linux.

>Insectroid, Mrs. Munchie, Cudlee's Quest, and Megapede).

I don't want to sound rude, but maybe another problem that MajicSoft has is
marketing--just like Atari Corp. I don't know the company at all.
Maybe if you list me some games that they made, I'll be able to recognize
the games.

I recognize Dave Munsie and some of the games you listed.

Maybe your company can put some of its games into an ST entertainment package,
send a few to the Atari publications left so that they write about it in
the publications, post an announcement in the comp.sys.atari.announce,
send some announcements to some online publications, and sell the package to
the few Atari dealerships left in the U.S. and the UK?

Some of the capital that is made from this package can be used to pay off
bills, get a Jaguar's developer kit, and put some money away for the
development of a Jaguar game.

>Granted, this company is hardly a MicroSoft, however, out of necessity for

Well, the companies I'm concentrating on with these campaigns have money that
they can gamble with.

Williams, Electronic Arts, and Capcom have the resources to develop a Jaguar
game or two. And I'd like to help convince them to do so.

>
>
>

Hahaha. Sega had 3% more marke share than Atari Corp. with the Master System.
I don't think that as being a major inroad!

What Atari Corp. has to do is lie about their sales estimate. Sega never
achieved their original sales estimate of the Genesis, but they were able to
get a lot of developers for the Genesis because of their estimate.

Sam Tramiel is being Mr. Honest by saying that Atari plans to sell 300,000
Jaguars this year. Sam could have at least stayed with the 500,000 figure.
And if they didn't reach it, Sam could have made up some excuse as to why
they didn't reach it (such as lack of games).

But by then, he has the game companies 90% finished with their titles.

Besides, I think with Alien Vs. Predator, Doom, Tempest 2000, Castle Wolf.3-D,
and a few of the other games that will be out this year, Atari should have
no problem selling 500,000 worldwide.

>
>Not at all Len! I've been an active Atari user since 1986 and up until very

>makes tons of $$$.
>

Well, it is my goal to make sure some of the popular titles are out for the
Jaguar. I want to see Mortal Kombat II, Super Street Fighter II, and
some other titles (which I prefer). If these titles are released for the
Jaguar, I'm pretty sure we will see the unit selling in the millions.

And if it is selling in the millions, I'm pretty sure the Tramiels will want
to try to re-enter the personal computer market. They just need funds to
do it.

I don't care if you don't want to participate in these writing campaigns,
but don't tell people that they are a waste of time. Because they aren't.
The letters will have some influence (to what degree I do not know), but they
will have some influence in the decision making process at these companies.

If they have a very small influence, so I lost a couple of bucks on stamps.
Big deal. I also lost a few hours writing letters. Big deal.

But if the letters do have great influence, then I will be playing some very
popular titles on my Jaguar. I will also witness Atari Corp. making more

products that I have come to enjoy over the years. :)

I managed to sell mine off for $650 minus my monitor. So, you should be able to get at least what you're asking as long as its in excellent condition.

Some Advice: Try selling it to a music store or a musican first. They will pay top dollar for such a system.

Ari

482. Four questions: ProTracker, GemView color printers, more

Newsgroup: comp.sys.atari.st
Date: 1994-07-09 18:41:10 UTC
From: paulseniura@delphi.com
Message-ID: <Zq8yxZ2.paulseniura@delphi.com>
Source record: 183880

I'm posting this to a few places, sorry for the duplication...

A few weeks ago I sent e-mail via Internet to the person listed in the ProTracker v2.0s documentation. Haven't heard back at all yet. Curious if I should even try sending the registration fee from Oklahoma USA to Norway(!), if e-mail doesn't get thru to him, ya know. I have some detailed questions about what v2.1 will let me do, with my upgraded 520ST (Turbo16 & 4-meg w/ TOS 1.04 & Warp-9 etc.). I can play most MODs at 27 kHz, sometimes have to step down to 24 when it gets too busy (it'll stop & tell me automatically). No real bugs to talk about at all! So I'm merely wondering if they've been able to "push" it some more, and also give us the kind of 11-bit resolution found in PT-Player v1.02.

A similar question (for y'all who might know) is whether I can get/build something to give me stereo DMA sound a-la STE for my 520ST? Afraid to spend more $$ for a STE (assuming I can find one :) cuz I need OS-9 from Cumana & it might cease to work with an STE. And would love to come up with DMA sound drivers for OS-9, too, hint hint, but I hafta be able to just upgrade my ST by adding the DMA circuits to it. Note: not just merely stereo 8-bit DACs (like STReplay & similar hardware), but DMA as well.

A third question for the people who might know: I'm *very* adept in doing circuit upgrades (practically rebuilt & redesigned my CoCo3 system, see). So I'd like to do the "38400-bps" upgrade which consists of a single 74LS74 chip wired to the MFP. The IMG drawing & doc was written by Jurgen Meyer & can be found at the Atari FTP archive sites. Only part of the doc was translated to English. I've got a 74F74 & switch ready to go if someone could tell me how it's working for you, and what-all does it really affect, etc.

Fourth & last question: It's only been a couple of weeks since sending in my payment for GemView, so I don't yet have the full-working version. I'm very interested in getting Canon's BJ-600 I believe it is: their color bubble-jet printer with separate ink carts for each color. Contrast it to the HP-550C which has the 3 primary colors in *one* cart and a second one for black (similar to Canon's early low-rez color printers, which I also have one but with Tandy's ROM in it). If ya run out of only one color, gotta replace all 3, and that's a waste not to mention costly.

So does the BJ-600 work with the HP-550C drivers in GemView? Does GemView merely "print what you see on the screen"? I.e. I would need "full-color" printing rather than "what you see", cuz my ST of course can only do 4K palette & 16 color registers, maximum. So getting a

color printer (no matter what model) would be a big waste if all I can do is "print what I see", and I would consider my $30 payment to Cybercube a big waste as well. (but monochrome mode printing works real good with my BJ-200 using the NEC 180-dpi driver, but I want to use 360-dpi mode!).

Someone's going to tell me to "look at the BJ-600 book and see if it does such-&-such". I don't have access to the book, and the sales people don't know either; I need to know if _you_ know if it handles the codes for a HP-550C. :)

Thank you for your time. If you would, please respond privately as I may not see your response before the system wraps it off the list.

> other terminal program I've used is as easy to setup or as
> (overall) easy to use.

This is what I use too. I also like the ability to run Emacs without having to terminate the program.

Is it possible to write a macro to tell Uniterm to initiate a transfer (or run any other program for that matter)? The macro docs are pretty sketchy and all the keypressing/pointing/clicking gets to be a pain.

Any way to change the default path? Setting it from the menu only seems to work for downloads.

Then wells_s@ix.wcc.govt.nz wrote:

if there is a reorganization, these 2 groups could probably be rmgrouped.

> 3) comp.sys.atari.st.advovacy /* already there ! */
note: it's comp.sys.atari.advocacy. no "st" in the name.

> 4) comp.sys.atari.st.hardware /* Hardware related topics */
> 5) comp.sys.atari.st.software /* Software related topics */
> 6) comp.sys.atari.st.programming /* Programming the Atari's */
i would personally prefer to see the "st" dropped from these names as well, since the ST isn't the only computer discussed in c.s.a.st as it is, and keeping the st in the names would be pointless if we're going to create new groups.

> 7) comp.sys.atari.st.mtask /* All about MiNT/MTOS/Mag!X/Geneva
i'm not sure this is the best name, but it's a good idea. in fact, i've been thinking of proposing a newsgroup for atari multitasking for a while, independent of any other reorganization.

> 8) comp.sys.atari.st.games /* Games and Fun */
i'm not quite sure dropping the "st" from this one is as good an idea as for the others, unless people are willing to put up with messages about atari's game machines. i'm pretty much indifferent as to any gaming group, though.

9) comp.sys.atari.announce, would, of course, remain unchanged.

486. hsmoda04.lzh, midi_com.lzh, flop_fix.lzh

Newsgroup: comp.sys.atari.st
Date: 1994-07-09 20:14:51 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2vn0fr$r9r@mailer.fsu.edu>
Source record: 183886

I just put these files (send to me by Harun, author of hsmoda0x, flop_fix,
and RSVE) up on atari.archive.umich.edu. Hsmoda04.lzh is the same as was
already there, with the exception of a file called falcon.txt (which Harun
asked me to add). Here it is for all you Falcon users out there:

--begin falcon.txt--

On falcons it is only usable if your program is able to use other interfaces
as MODEM1 / AUX, because the serial interface is MODEM2 (Bconmap 7).
Connect is able to use these.
In some weeks a new version will be released, which provides access to
the Falcon serial interface thru AUX/MODEM1 too. This future release is actually
in the beta test.

--end falcon.txt--

Flop_fix.lzh fixes some floppy bugs in TOS 2.0x. It appears to be
particularly useful for HD floppy owners, but 720k drives might also benifit.

Midi_com.lzh is a demo of a German MIDI network package.

> InterLink but still need to go to school to get the files on the floppies.
> I would like to just get the files from my account to my TT without using
> the school's computers (and those _slow_ floppies.)

I think perhaps you have a misconception about ftp for your TT. Unless you connect the TT directly to an Ethernet or other network, you will still be forced to use modem speeds for any remote communications. If you did get a SLIP or PPP setup going on your TT (which would allow you to use ftp), all this would do is simulate a network over a modem. Nothing would become magically faster, so you would still be receiving data at modem speeds (it would just look like a really slow Ethernet, as far as the two machines are concerned). Thus, even if you achieve your goal of getting ftp working on your machine, you will not gain any real performace (in fact, you might loose some, as Zmodem is more efficient for data transfers than SLIP or PPP).

What you probably need to do is get a faster modem (14400 v.32bis, about $125 for a cheap one) and a better modem program. I often download 5-6 megabytes of files in the time it takes me to eat dinner or watch a good TV program (scarce as those might be, in the US). I suggest you use CoNnect on your TT (I would LOVE to have a TT for use with CoNnect). Be sure to use hsmoda04.lzh as well, to get the most out of your serial ports. My understanding is that you can use a TT running MAG!X while downloading stuff at 38400 in the background with very little delay on the machine. If your school machines do not offer Zmodem, it could probably be added by your system staff.

So, I think you will have to spend a bit of money, I'm afraid. CoNnect costs $50 to register (it is shareware), and the modem will be between $125-$200. CoNnect is extremely nice on my MegaSTE (and should be even better on your TT), and is well worth the money IMHO. You might have luck in finding a used 14400 modem on misc.forsale.computers. Some of the prices I see over there are unbelieveable (I suspect some of this stuff "fell off the truck", as it were).

Hope that helps.

>
> So you can dnload all the zip and lzh files in one go, like *.lzh *.zip..

Roger, don't take this as a slam or anything, but this is _not true_ for Zmodems in general. In particular, it is not true for the kinds of Zmodem implementations that _most_ Internet users would encounter (see below). I suspect it is true only for a _very_ few Zmodem implementations period (yours included, unfortunately). Are you using a VMS machine by any chance? This would explain a lot....

> Try that with any other Zmodem....

I have, on many occasions, and it always works. I have personally compiled three different Zmodem packages for Sun workstations (4.1.x and 5.x), and have compiled and installed versions for IRIX, AIX, and other UNIX flavors. They _all_ work perfectly, including the ability to up/download with wild cards. In fact, you can use the UNIX style regular expressions with all of them, which is an extremely powerful set of wild cards.

Zmodem, by default, can up/download multiple files (i.e. "batch" mode has always been a part of the Zmodem protocol). It is no big trick to make a UNIX Zmodem work with this feature, as you usually pass all the file names on the command line. In UNIX, the shell is generally responsible for expanding any regular expressions _before_ they hit the invoked program as arguments. Thus, the ability to use wild cards for any command line UNIX implementation of anything boils down to the programmer being able to handle argv[] correctly. Thus, this feature is not only available, it can be considered _trivial_ for virtually any UNIX implementation of Zmodem.

So, for any UNIX flavored operating system, it is my guess that you would be very hard pressed to find a Zmodem that does _not_ handle wild cards correctly. My suspicion is that this phenomena is not unique to UNIX implementations. I also think it is the case that a vast majority of Internet folks are using some sort of Open System (i.e. UNIX box) to access the net, either directly or indirectly. Those systems that support Zmodem almost certainly support wild card usage as well, based on what I have said above.

Thus, while your comment is certainly true for whatever Zmodem _you_ use from _your_ particular remote host, it is _not_ true for very many other

folks :-). Please let me know what kind of system you are using. I may
be able to point you to a Zmodem implementation that will allow you to
use whatever Atari package you want (and still work perfectly).

> Also XYZ is very very slow and OLD, use GSZRZ228 instead, you will find
> this is the fastest Zmodem there is for the Atari.....

I concur, though I think the CoNnect internal Zmodem is so close to the speeds
that Gem SZRZ 2.28 can achieve that they are indistinguishable. Later
versions of Gem SZRZ may be faster, from what I hear.

The above is based on my own personal experience, and is therefore IMHO.
Direct flames elsewhere.

491. Midi Program for live playing

Newsgroup: comp.sys.atari.st
Date: 1994-07-09 21:37:10 UTC
From: bpage@infi.net
Message-ID: <bpage.15.00159F42@infi.net>
Source record: 183895

Does anyone know of a program (preferably shareware) that I could use on my ST to co-ordinate my midi rack in a live music situation? I have a couple of guitars that are out-fitted with hex pickups and feed into an IVL 7000 midi guitar set-up. I use this to control a couple of sound modules and would like to use my ST to send various changes to the modules as well as a couple of effects modules. The IVL has a pedal board that allows me to send patch changes on pre-selected midi channels--it would be great if I could find a program that allows me to "trigger" set-ups via patch changes.

I do have DR T's Omega package and can use that to change anything that I want from open mode (via computer keys), but that is of course restrictive during a song. I know that Song mode is also suppose to allow you to trigger a song via a program change message, but I'm at a loss at how to configure this to start a song; ANY song at ANY time via program changes.

If anyone knows how to do this with DR. T and song mode, or knows of another program that would do better, I would really appreciate the information.

Thanks,

--> Bob Page

Fine Len, you've made a fair point or two and its your stamps so goahead and write away!

BTW, as for your earlier suggestions regarding MajicSoft - please give me the benefit of the doubt here. I tried much of what you said out of desperation since the company management didn't want to listen to msuggestions.

It's a shame really, I lost out on substantial royalties which would have gone a long way to paying my education and the Atari users lost out on several good products. Now, the company isn't dead yet - but its on a respirator and sinking fast.

Originally, they had planned to get into Jag development but they started to have financial troubles...

BTW, Atari doesn't lie about sales figures - instead they don't post them so vendors have no idea how big or small their market is! That might spare Atari pride but makes product development very risky for potential developers.

Regards,

Ari

495. Help (STE owners)

Newsgroup: comp.sys.atari.st
Date: 1994-07-09 22:52:38 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2vn9nm$r9r@mailer.fsu.edu>
Source record: 183893
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

First, my request. I would to get several folks who own STEs of all different types to verify something for me. Basically, in color graphic demo Brain Damage, there is a disk load portion that plays a heartbeat sample over and over. On my MegaSTE, that sound crackles like hell. I believe this (and other crackling when using the DMA sound on my early model MegaSTE) is indicative of the GST Shifter bug that has been discussed on this group. I would like to verify this, as I need a positive test for this problem (see below for details).

So, to make it easy, I have put the Brain Damage demo on my own ftp server, along with everything needed to use it. This demo will only work with STEs in color (it is an awesome demo BTW, a must-have). If you would like to help me, simply run the Brain Damage demo, note if you hear lots of crackling during the heartbeat sample (it occurs for about 30 seconds, after the initial intro screen, before the demo proper), and send me an email mentioning what kind of system you have and if you heard crackles. I would be interested in the amount of memory you have as well. My email address is boyd@math.fsu.edu.

If you don't already have Brain Damage <grin>, ftp to ftp.math.fsu.edu (192.12.122.28) and look in /pub/atari. I have made it into four parts for easy tranfer by 720k floppies. Also included are lha310.tos (lharc 3.10) and msa_2.3+.prg, which can be used to uncompress the files and put them onto floppies. All of this stuff is on atari.archive.umich.edu as well, but it is always swamped with Atari folks :-). If you do not have access to ftp but would like to help, send me some email and I'll figure out a way to get the files to you.

Ok, now the long winded reason for this. Basically, after having just gotten the new version of Octalyzer (an excellent mod file player for the STE/Falcon), I can no longer stand the crackling. The previous mod player I was using did not make the crackling stand out too bad, but Octalyzer sounds so much clearer that the crackles really stand out (and they drive me nuts!). Again, the crackling is caused by the use of an older GST Shifter chip in early MegaSTEs. The fix is to install a newer revision GST Shifter chip.

I can buy GST Shifters from Best Electronics, but they don't know how to tell what revision they are (I need a rev. D or later). So, I called Atari. Based on what others had said on the net, I was not expecting them to be very much help. However, I was very pleasently surprised to find that they are willing not only to service my machine, but to do it for free (given that I am correct about it being an early model bug) even though the machine is long past warantee. They estimated that it would only take a week or

two!

So, I am getting ready to send my MegaSTE off for some work! However, I want to include something that positively shows that the problem exists (and that it went away, after they work on it). I'm not sure about what shape their service department is in, so I want to make it as easy as possible for them. Thus, my reason for the request above finally becomes clear!

Thanks a million billion zillion in advance for any assistance. In particular, if you are a MegaSTE owner, I would also be interested in the markings on your GST Shifter chip (especially if it doesn't crackle). If you don't mind lifting the small cover on the top of the machine, the GST shifter is the large square socketed chip right next to the upper left hand corner of the SIMM sockets. A small bit of the chip is underneath the grey metal shielding in the middle of the machine (not a part that has any markings on it). The writing will be upside-down. All of this is when viewed from the front of the machine, and only the small top cover need be moved to see it. Please do this only if you are totally comfortable with lifting that small cover. Just the information on crackling would help!

If, by some quirk of fate, anyone has information about how to identify the revision of the chip from the markings (Atari refused to tell me, but that is consistant with their policy), or if anyone has a dead 1040STE from which I can purchase the GST Shifter (my understanding is that only MegaSTEs received bad ones, and any 1040STE shifter will fix my problem), or if you have some other source for a GST Shifter chip, please let me know! I am still a tiny bit leery of sending my machine off to Atari, so I would rather fix it myself.

Does anyone know of a DOS utility to read/write/format ST floppies? My ST has a single-sided drive.

I've been able to partially read ST floppies on my PC. Is DOS's FAT compatible with the ST? Can DOS's format utility format a disk for the ST if I know the correct track/sector info?

Any tips would be appreciated.

Well, 2 programs come to mind Ka9qnos or something like that but
it is a non GEM.

The other program is GEM, it's called Hermes and is 60 DM of shareware.
Takes up 3.7 mb on a hard drive.

Both are on the Atari archive.

But, if you write a program using Stalker script I would be willing
to Beta Test it. Please, make sure you make it able to use dynamic
addressing. My, university uses this type of ip addressing.

I use STalker and ask a friend of mine if he would try but he didn't
think he could do it.

> Loren Kirkby

TOS 1.0 and 1.2 will not put the correct bootsector for DOS when formatting a disk from the desktop. All other TOS versions will. There are lots of other formatters that will do the job properly. My personal favorite is ps2form.tos, available on atari.archive.umich.edu. You can also use DC Format to write only the bootsector (so you can make existing disks DOS compatible, as only the bootsector is incorrect). Note that DOS boxes don't like any of the common ST extended formats, so regular 80 track 9 sec/track non-twisted formats should be used. You can find out what version of TOS you have by using the program sysinfo, also on atari.archive.

As you point out, formatting the disks on a DOS machine will solve the problem as well. Be sure to format the disk DSDD (720k format).

502. Why doesn't Flop_fix work for me?

Newsgroup: comp.sys.atari.st
Date: 1994-07-10 06:23:21 UTC
From: chanck@tartarus.uwa.edu.au
Message-ID: <2vo44p$4mt@styx.uwa.edu.au>
Source record: 183900

Hello all,

I am having some problems getting Flop_Fix to work on my system. I have installed the program into my auto folder (making sure that it is the first program in the folder) and when I boot my computer up it tells me that it has installed the floppy fix. But when I try to open any of the floppy icons it just reads the floppy and then nothing happens... No window, nothing appears. When I double click on the floppy icon again, nothing happens at all. No disk whirl or anything. Am I doing something wrong? I have booted up with a totally clean system (no auto programs or acc) and still this problem persists. Help!!!

My system is a Mega 4 STE, TOS 2.06, Mono, ICD Pro driver with a 240Mb Quantum (LP240S).

Any help would be much appreciated.

regards
Gary Chan
chanck@tartarus.uwa.edu.au

PS: What bug does Flop_fix fix up? Do I need it? Says something about needing it for TOS 2.06 which is what I have.

Hey, I'm looking for the full version of an AVS animation called CATNAP.
I have seen that there are a few edited versions floating around (for 1
meg systems etc.) Does anyone have the full version or know where it
resides?

>What genuine opinion from some USERS ????????

It depends on what you're using it for. A lot of CD-ROM games DO
suck eggs, as do some of the 'multimedia' and 'edutainment' titles,
but if you're going to use it for CD-ROMs with clip art/fonts/pics
or somesuch, or as a 'instant BBS' downloading drive for the CD-ROMs
filled with PD/shareware software, then they can be very useful.

The NEC CDR25 is a single-session and SLOW (800ms access???) drive,
but it could easily be used for the latter examples above (except
for viewing multi-session PhotoCDs, that is!).

I'm not surprised the WSJ reported that about CD-ROMs. Especially
when it comes to GAME CD-ROMs, there are very few that are really
any good -- the current CD format just isn't efficient enough for
what some games need (which is why Atari, Sega, and Nintendo have
opted for their new generation systems to be cartridge AND CD-ROM
based (CD-ROM optional for the Jaguar and Ultra-64). Generally
speaking, you really need hard drive speed performance (>500K/sec
transfer rate and <30-40ms access time) for games.

Full motion video (FMV) on CD is pretty sorry too. For the most
part, it's still sub-VHS quality (and MORE EXPENSIVE than VHS!),
plus IBM clone users need a converter if they're going to watch
it on their TV (how many people want to watch movies on their
computer monitor???).

I'll probably buy the Jaguar CD-ROM drive when it comes out just
to check it out, but unless some good titles come out for it, I
may get rid of it fairly soon afterward. I'm optimistic, though,
because so far, most quotes from Jaguar developers seem to be
griping about how most CD-ROM game titles suck because the
developers didn't know how to use it, so hopefully we have some of
the more capable people able to work around CD-ROM's limitations.

Hi there,

Does anyone have a list of the pin-outs for the Mega ST internal DMA port, or could you direct me to any docs covering the same on an FTP site.

Thanks,
John

Well here I am Roger. Hutch dragged me kicking and screaming over from GEnie
and I finally have found reasonable Inet access.

For the record, ICD has been around for over 10 years and that is longer than
the Tramiel Atari and many Atari users.
We have had our ups and downs but have kept going for better or worse.
Our company has been shrinking and with a much smaller staff we can't possibly
provide the kind of support that we would like to or that some took for granted.
I will make an effort to monitor Inet topics through Delphi as much as I can
afford.
I also do answer most EMAIL on GEnie (ICDINC) and CompuServe (76004,1600).

Presently we ship most of our product through Pacific Software and Toad which
are
great distributors.

Our booter is up to version 6.5.5.

Later,

- TOM -

To which Jeff Kovach replies...

Do you know if you are right-eyed or left-eyed? Most people are right-eyed,
and I would imagine that this type of stereo image could be affected by which
eye your brain favors.

To determine whether you are right or left-eyed, look at an object in the
distance. Then, extend your arms in front of you and form a triangle with
your hands, using your thumbs as the base. Position the triangle so that
an object in the distance is in the center of it. Then, close one eye.
Open it and close the other eye. You will find that they object will remain
in the triangle for one eye - this is your favored eye.

I will be surprised if you are not left-eyed.

You've used PEEK(address) ?
If you're using LPEEK or DPEEK you must be quite sure that what you
are trying to read starts on an even address. 3 bombs indicates
that you may well be using L or DPEEK on an odd address.

515. ATARI SYSTEM FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1994-07-10 21:44:21 UTC
From: alberto@terapin.com
Message-ID: <alberto.5o4r@terapin.com>
Source record: 183829

-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-
ATARI COMPUTER FOR SALE
-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-

ATARI 1040 STE - 4 Megabytes of Ram, Tos 1.62, stereo outputs
DMA sound, enhanced joystick ports, 4096 pallete
etc.

ATARI SC1435 - 14' Color Stereo Monitor
Includes swivel stand and stereo cables comming from
the computer. Nice display.

Maxtor LXT 200S - 200 Megabyte 15ms Hard Drive, recently purchased
as an upgrade to a Segate 20 Megabyte Drive.
Installed in original case so there may be room
for another HD. There is an opening in front of
the case which was left after the upgrade so the
case isn't "original". Makes for good ventilation
though. Alot of room at high speed, VERY
very quiet.

ICD Host Adapter Plus w/clock + Software/utils is also installed in
this case. Have the original manual/disk as well as the latest
software upgrade on the hard drive.

Epson LQ-570 - 24 Pin printer, 11 built in fonts, 360x360 dpi
Can use both single sheets/envelopes, etc. or printer paper. Very
nice quality for text/graphics.

Supra 2400 Baud Modem - A modem, they're quite useful. :)

Already installed on the hard drive, all sorts of utilities and
shareware/pd programs. This system is in NEW condition, not used much
and still in boxes with all manuals. It was mainly used for simple
word processing for school using Word Up(included). This is the
perfect system to learn on, with plenty of memory and room to get into
advanced things such as programming(C Compiler on the HD), etc.

Need money bad, so I have to let this all go. Sorry I will __*NOT*__
sell this system in parts whatsoever -- DON'T ASK. If you have any
questions or are interested, please let me know.

Since the prices have gone down SOOO much, I'm asking that you make a
reasonable offer instead of setting a price. Keep in mind the
condition of the system(New) and the amount of use(not much at all).
I'm thinking around $850 although I paid ALOT more for it but make an
offer.

Mail only please.

Thanks,

alberto@terapin.com

518. Re: Latest ICD 6.4.3 software/Upgrading to 6.5.5

Newsgroup: comp.sys.atari.st
Date: 1994-07-11 00:20:02 UTC
From: icdinc@delphi.com
Message-ID: <BQ0RyQK.icdinc@delphi.com>
Source record: 183967

There are actually 3 versions of our software and they are all maintained with the same version numbers. They are AdSCSI, Link, Pro.
AdSCSI is the old standard that we allow to be downloaded on GEnie and CompuServe.
The Link version ships with the Link and The Link 2 and adds CDROM support and Floptical support.
anup and SCSI.PRG which is a
utility to read/write/edit, etc. SCSI and IDE commands.
The Pro version is also totally unprotected so that is what you will find on pirate boards. :-(
It supports all Atari 16 and 32 bit computers and their hard drives except for the ST Book IDE drive.
Pro sells for $49.95. Updates for any of our software except TAPE.PRG are available by sending the master disk(s) and $15 to the address on your ICD manual or diskette. We haven't moved in 10 years.

I hope that answers your questions.

This will probably do you, on the left are the pinouts of the DB19 connector (standard DMA) and the left the 24pin internal conector. Just look in the manual for the actual function.

DB19 IC24(Internal)
1 - 2
2 - 4
3 - 6
4 - 8
5 - 10
6 - 12
7 - 14
8 - 16
9 - 18
10 - 24
11 - 1, 7, 9, 17, 20, 21
12 - 3
13 - 5
14 - 11
15 - 13
16 - 19
17 - 15
18 - 22
19 - 23

I hope this helps.

Evan K. Langlois (ekl@sdf.lonestar.org) wrote:
: >:] all.
: >Nothing can scroll as fast as version 1.91 either.
: >

: That is incorrect. ANSITERM doesn't run on /dev/fasttext or a vconsole.
: Anything that does will use hardware scrolling (needs an STe, or at least
: a machine with something less than a 256 byte video boundary!) and I've
: clocked text output to the screen at well over 7000cps just using fwrite
: on a line by line basis. If you write more than a line at once, then it
: only gets FASTER. And scrolling is instantaneous. Text output is slowed
: by the 16Mhz processor drawing 16 bytes/char - not by screen scroll!

I know how ANSITerm works. I wrote it. It uses a hardware scrolling method
that works on regular ST's. But this feature was added to version 1.91 which
you have to register to get. The older versions scroll no faster than
anything else that just copied memory to scroll.

: >: For ease-of-use, speed, and net-compatibility, don't look any further
: >: than Uniterm or Flash (Not Flash-2 which is very slow, and quite buggy!).

: The only program I found to have flawless vt100 was Connect. In fact,
: the only differences between Connect and my [d][i][g][i][t][a][l] VT-240
: terminal (provides vt52, vt100, vt220, and tektronics 4014) was that
: Connect was faster, provided vt102/ANSI, was more configurable, and used
: extensions on the vt52 for color (like ATARI does). However, I simply
: uploaded my own termcap file and set TERM and TERMCAP appropriately,
: so I get stv52 (virtual console extensions) to vt52 on the local Linux site.
: The sysvr3 site I'm on now won't recognize TERMCAP and the sysadmin won't
: append my termcap entries, so I use plain vt52. I have never needed vt100
: yet!

: >

: And that program is horrible. It is too low level. A file transfer doesn't
: need super-visor mode, and I see no reason why it has to be so hardware
: dependant. The REAL sz and rz can run over a pipe if you want them too!

I'm sorry you dislike it so much. Why don't you write starfall@genie.geis.com
and tell the developer.

For me and the users of ANSITerm, XYZ works just fine. I couldn't find anything that met my needs better.

527. FLIs and Hypermedia

Newsgroup: comp.sys.atari.st
Date: 1994-07-11 02:54:47 UTC
From: sccoe@ucscb.UCSC.EDU
Message-ID: <2vqc9n$69p@darkstar.UCSC.EDU>
Source record: 183979

I am wondering if anyone can recommend a hypermedia program that will run (or can be forced into running) on a FALCON. HYPE? HYPERLINK? What is good? What will work? Do any do Falcon graphics-modes with color and all (GIFS & FLIs maybe)?

My other question is about FLI animations: whats a good player for the Falcon and where can I find it?
TIA!

529. quartet program - where can I get .AVR samples?

Newsgroup: comp.sys.atari.st
Date: 1994-07-11 03:21:41 UTC
From: cbrasted@physics.adelaide.edu.au
Message-ID: <2vqds5$be2@quandong.itd.adelaide.edu.au>
Source record: 183981

Subject says it all really. I just got hold of the Quartet program and I want to find an ftp site that has some more .AVR samples. Does anyone know if such a site exists?

Also, I would be down loading the files onto my unix account, saving them onto a pc disk, then loading them onto my 1040st. I know the st can read pc formatted disks, but I am not sure exactly under what conditions it can be done. Any wisdom would be appreciated.

email or post here, either is fine.

Thanks,
Charles.

That all depends on the computer that you have. If you have a Mega ST, I would suggest putting an internal drive in. We sell AdSCSI Micro ST host adapters with software for $39.95 (closeout).

Otherwise an external with a SCSI connector on the back and our Link 2 host adapter
works well. Toad computer is a good supplier and can give you good prices.

532. Re: Reading ST floppies from DOS

Newsgroup: comp.sys.atari.st
Date: 1994-07-11 04:25:36 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <ZgxTSaI.ari2550@delphi.com>
Source record: 183982

BTW, if you want to read old ST formatted 720kb (DS) floppies on a PC you can use a program like NORTON's DISK DOCTOR. It will correct the disk to standard MS-DOS specs. I've done this myself for many ST disks that I formatted on my 520 or on my 1040STE using a fast formatter.

Again, as others have said here - try using one of the many formatting utils available in PD & Shareware to write PC-DOS compatible disks.

Ari

: TIA!

The ALOE FLI player works best in my opinion. It can play 90% or more of the FLI's I throw at it. It's from France and I found it on GEnie.

The other one I know of is MOVIE100. It plays animations in a window and works with MTOS and runs in several resolutions but it has problems. It only plays less than 10% of my FLI's. (2 CD's worth) It can be found at any major FTP site. Let me know if you can't find them.

Actually, I can't get peek to work at all. It seems that the address I'm
using, ($FF9210), is beyond the peek range, or something like that. The
only way that I _can_ get it to read the data is DPEEK(). I have actually
got one portion of my problem working since I posted the message, but I
cannot read the paddle positions from locations &HFF9211 and &HFF9213.
Any hints, anyone?

: To which Jeff Kovach replies...

: Do you know if you are right-eyed or left-eyed? Most people are right-eyed,
: and I would imagine that this type of stereo image could be affected by
: which eye your brain favors.

Being left- or right-eyed has no bearing on the 3D image seen. There are two methods for viewing these images, the convergent (cross-eyed) method and the divergent (parallel-eyed) method. Most 3D images have been prepared to be viewed using the divergent method, i.e. focussing the eyes beyond the page. Some have to be viewed using the convergent method. There are others which can be viewed by either method although these ones usually contain abstract shapes rather than an actual scene. Viewing an image using the wrong method results in the 3D image being inside-out (or a complete jumble).

I hope this helps,

Dylan

Date: 1994-07-11 10:13:58 UTC
From: andrew@minster.york.ac.uk
Message-ID: <773921638.11535@minster.york.ac.uk>
Source record: 183996

Well, the subject says it all.

I played this game for about 15 minutes before loosing my first ball!

The response from the flippers doesn't feel right either. I hit the keys harder but the ball doesn't move any faster :-). Really, I've played Pinball Fantasies and the response feels much more natural.

Otherwise, the graphics and audio are very good, I just think the gameplay needs tweeking a bit more.

```
Given the relatively low (and dwindling) amount of traffic in the
current Atari newsgroups, in general I don't think it's worth the
effort to create new groups.

> 1) comp.sys.atari.st /* already there ! */

> 2) comp.sys.atari.st.tech /* already there ! */
> 4) comp.sys.atari.st.hardware /* Hardware related topics */
> 6) comp.sys.atari.st.programming /* Programming the Atari's */

These three groups will very likely overlap a lot. c.s.a.s.tech
already serves the purpose of a more hardware/systems-programming-
oriented group.

> 3) comp.sys.atari.st.advovacy /* already there ! */
> 5) comp.sys.atari.st.software /* Software related topics */

This is what c.s.a.s is for.

> 7) comp.sys.atari.st.mtask /* All about MiNT/MTOS/Mag!X/Geneva */

Most of these questions and discussions are also a perfect fit for
either c.s.a.s or c.s.a.s.tech.

> 8) comp.sys.atari.st.games /* Games and Fun */

You might get me with this one. Personally, I'm not interested in
discussions about games at all, so I wouldn't mind if there
was a separate group for it. On the other hand, I have not
seen many postings about games recently, so I don't bother
about them.

No, after thinking about it again, I don't think we need more
groups.

> Thanks for any help. I find myself getting an invalid address error (3
> bombs) quite often. Help is much appreciated.

First of all, make sure you're accessing these locations in supervisor mode. This is no problem for PEEKs or DPEEKs since they switch into supervisor mode automatically. (BTW, this is an area for enourmous optimization in many GFA programs where non-system memory is PEEKed into.)

Second, use PEEK to access odd addresses, DPEEK for the even ones. DPEEKing at an odd address will raise an address exception on 68000 machines.

Mickey this info comes Direct from Omen, the PD version 1987 does not support
Wild card, later versions of Zmodem are not PD and you have to pay to use them,
have a talk to Wolfgang (Connect) if you don't believe me, and Michael Ziegler
the GSZRZ chap, they all confirm this....

People that write Zmodem programs for the Atari use the old 1987 PD standard,
they can use the later Zmodem 90 if they pay for it, so may be you are using a
Zmodem standard that you should not....

It multiplies by 4 not only your bonus, but also any score. Moreover, the ball seems to be heavier when energized.

552. Starball

Newsgroup: comp.sys.atari.st
Date: 1994-07-11 13:51:43 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <2vripf$6pn@m1.cs.man.ac.uk>
Source record: 183552

There is no way of cleanly exiting Starball. This is because I would trust TOS to leave the ST clean about as far as I could spit a rat. The Shift-Esc thing is only there for emergency exit during development.

553. Comms Programs

Newsgroup: comp.sys.atari.st
Date: 1994-07-11 14:07:48 UTC
From: julian@loose.apana.org.au
Message-ID: <2vrjnk$7ja@werple.apana.org.au>
Source record: 183804

Well....didn't I start something when I asked a simple question like what comms program to use.
Firstly, thanks for all the responses. I've tried out HEAPS of programs and I still think that Freeze Dried Terminal is the best. My problem with it was that in the scrollback, I often see an arrow at the end of a line and I can't scroll that way and so I loose all that infomation.
I'm told that it's because Unix doesn't send a cr with a new line character. I'm no expert so I don't know if that's right or not but it is annoying.
What is NOS or AtariNOS? Is it a comms program? If so, where do you get it?
Thanks, julian@loose.apana.org.au

554. SLIP for the ST?

Sorry if this has been been brought up before..

Can anybody supply information/locations of a SLIP software kit
for the Atari ST (1040FM). I'm currently runnning a UUCP system to
get my mails and news, but would like to investigate SLIP as an option.

Reply to the group for general consumption please...

Thanks in advance

> anything that met my needs better.

Is XYZ.ttp still being developed? The last version I saw was years old.
GEM SZRZ 2.28 can blow it out of the water, as can CoNnect's internal Zmodem
(from a speed standpoint). I hear that the registered GSZRZ 4.x versions
are even faster. What is the newest version of XYZ you have seen? I seem
to remember a 2.2beta or something like that (being the last version)?

You should be able to use GEM SZRZ in place of XYZ in most cases, as it
supports the same secondary text file batch format. I suggest you give it
a try. I'm sure the significant additional speed, coupled with the much
nicer and more informative user interface would be welcome additions to
Ansiterm users.

>available to buy (ugh!) ...
>
>What genuine opinion from some USERS ????????

I agree with Steve Johnson's comments about the overall value of CD-ROM, but let me add this:

IMHO, the NEC CDR25 is too slow for most 'edutainment' CD software. In fact, I have a Mac CD (Iron Helix) that claims incompatability with the CDR25. I would recommend putting your money towards a double-speed mechanism.

Personally, I've been awed by some of the neat stuff that I've seen on CD but I also realize this technology is still in its infancy. CD capacities are going to increase as will the data transfer rates and as the technology matures we are going to see some really fantastic capabilities arise. While titles specifically for the Atari are very few that situation is apt to change.

I don't know what the Wall Street Journal article said, but I've been _very_ pleased with my CD and I'm not about to give it up just yet. :)

560. Info about ST required

Newsgroup: comp.sys.atari.st
Date: 1994-07-11 16:10:44 UTC
From: steve@g6vju.demon.co.uk
Message-ID: <773943044snz@g6vju.demon.co.uk>
Source record: 183809

Hi everybody,

I've recently been asked some questions about the Atari ST and as I'm unfamiliar with these machines said I would try and find out for them. Appologises if the answers can be found in an FAQ somewhere.

Basically what they would like to know is:-

1. What processor(s) does the ST use?

2. Is it in anyway compatable with the IBM PC, or are there any emulators available to allow it to run PC software?

3. What is the operating system like, is it a GUI?

If it's not asking too much, please reply by email, as I don't normally frequent this newsgroup.

Many thanx

Steve

: black if they were produced in that color, also
: is this worth doing? Is the resolution on a composite
: monitor better than the TV?

: Also a black composite monitor with an ATARI logo
: would be perfect! Thanks...

I ended up finding a floor model Sony trinitron with S-Video Input.

So I bought the S-VIDEO cable from ATARI for the Jag. Let me tell you
it looks and sounds awesome ! The video is clear, the colors are sharper
and this particular TV has surround sound. I would recommend buying a
TV with S-VIDEO input to any other Jag owners out there, considering TVs
are relatively cheap compared to monitors and then buying the S-Video
cable for $20 bucks from ATARI. How bout a Jaguar newsgroup, anyone ?

Source record: 183812

I have recently found out that I am one of those people
that can see them both ways! A paper in DC had an excellent 3d pic
on the front page. Up till that time I could only see them inverted,
which is a real pain in the butt! They are really hard to make out
that way. With the help of my Daughter-in-law I was able to see them
the right way around ie. sticking out of the page. The trick is those
that see them inverted are crossing their eyes to bring the 2 registration
dots on an stis pics together, the right way is to see each dot with
the appropriate eye ie. left dot with left eye, and right dot with
right eye. To do this I have to bring the pic in till it almost
touches my nose an everything is out of focus then slowly pull it
back till the pic come into focus and at this point you can actually
see them right way around. The statue of liberty and Lincom Memorial
pics in the 4th of July issue of that paper were terrific!

566. ST FEST at INDY

Newsgroup: comp.sys.atari.st
Date: 1994-07-11 18:17:39 UTC
From: Paul Purdom <pwp@cs.indiana.edu>
Message-ID: <1994Jul11.181746.24787@news.cs.indiana.edu>
Source record: 183814

Actually,
From shuffman@ideanet.doe.state.in.us Sat Jul 9 21:50:09 1994
but edited.

AtariFest VI will be one July 23 at the Best Western Waterfront Plaza Hotel,
Indianapolis. Hours are 10 to 3 CDT/EST (11 to 4 EDT). Admission is $3.

Here is a current Vendor/User Group list as of July 7

Vendor tables are now $60 plus $15 if electricity is needed. User groups
now are $20 plus electricity.

Here's the list as of July 8:

Commercial Vendors:
D.A. Brumleve (Kid Prgs), Urbana, IL
Missionware (Flash, etc), Palatine, IL
Rising Star, Dayton
Clear Thinking (Edit Plus debut), Ann Arbor
MTS Creations, Chicago
Gribnif, Northhamton, MA
Megatype, South Bend, IN
DMJ
It's All Relative, Missouri
Branch Always, 1 table (tentative)

User Groups:
ACORN, Ft. Wayne
EAUG, Collinsville
LCACE, Waukegan, IL
THE, Terre Haute
CIN'TARI, Cincinnati
CUSTUG, Champaign, IL
Miami Valley ACES, Springfield, OH
BLAST/ASCII, Bloomington/ Indy
ACEC, Columbus, OH
CRAG, Crown Point

Individuals:
Doug Palmer, Solon, OH

Bruce Welsch, KC Atari Connection, called to say he is bringing a vanload
of "hard core" users (including Electronic Spinster Linda Peckham), and
he expects that Kent Kordes of Systems for Tomorrow (he of the $99 CDR
drive) to be setting up a table too...

We are pretty excited that the ballroom is filling up so rapidly, but Charlie Sears has things under control (at least until we pass 40 tables).

Please do feel free to pass this message on to anyone who might have an interest. Call Charlie Sears at 317/535-4829 or me Office: 317/232-6618 or Home evenings and weekends: 812-988-7558.

Hotel rooms are $53 single, $59 double: Mention AtariFest to get that special rate (and get us a $10 rebate, too). Call the hotel at 317/299-8400 x393. (Be sure to mention AtariFest when you register, even if you make reservations in some other way).

See you there...

[rest deleted]

I'm using UPoint to access mail/news via uucp. If you do not need all the features of Hermes, UPoint may be a good choice. It's a full GEM-applikation, faster than Hermes, can be used with MultiTOS or Mag!X (polls may be done in background etc.) and the hole program takes less than 2 mb on my HD.

There is a free public domain version called 'UPoint light' and a "commercial" version called 'UPoint medium'.

If you need more details ask the autor of UPoint:
brusch@eslapion.sh.sub.de

Ciao, Arno

In message #3, steve@g6vju.demon.co.uk writes:

> 1. What processor(s) does the ST use?

ST and STE uses 8 Mhz 68000
MEGA STE uses 16 Mhz 68000
TT and Falcon uses 68030

> 2. Is it in anyway compatable with the IBM PC, or are there any
> emulators available to allow it to run PC software?

There are several software emulators (not very fast :-)
And some hardware (I have a 16 Mhz 386sx card in my MEGA STE)
The hardware emulators are good and fast and very useful.

> 3. What is the operating system like, is it a GUI?

ST's use GEM, but a much better version than GEM/3 for the IBM PC
(looks quite similar to the MAC).

The disk operating system is called TOS.

: of creating them from grey scale images but I was curious if any such
: beastie exists for the Atari.

: -Hutch- @ Fair Dinkum Tech

Apparently, there is one called Auto Stereogram Creator from Europe.
Unfortunately, it comes rather poorly regarded. ST Format June 94' says:
"drawing is a clumsy affair, you can only step through acreen layers,
there's no undo option, there's no print option" etc. etc...

Perhaps if someone could code a program to use an image (for texture) and
a Cyber Studio object (.3D2) for the three dimensional effects. Most of
the Stereograms that I have seen have shapes with relatively little
detail with either a random dot pattern or a repeating wallpaper texture
mapped onto the shapes. A little processing to split the image and
overlap the right pixels and Presto, stereogram.

Does this mean that Outside is a Falcon/TT only program? I can't read
German so I haven't been able to discern this from the Outside Demo.

BTW, Outside is a Virtual Memory program for Atari computers - presumably
the TT and Falcon only.

Charles Brasted (cbrasted@physics.adelaide.edu.au) wrote:

: Subject says it all really. I just got hold of the Quartet program and I want
: to find an ftp site that has some more .AVR samples. Does anyone know if such
: a site exists?

: Also, I would be down loading the files onto my unix account, saving them onto
: a pc disk, then loading them onto my 1040st. I know the st can read pc
: formatted disks, but I am not sure exactly under what conditions it can be
: done. Any wisdom would be appreciated.

You may wish to pick up Soundlab (from DMJ) which is a superb shareware
digital sound editor, conversion, player program. That will allow you to
convert many types of samples into .AVRs (and of course, if you find it
useful, register your shareware).
As far as IBM disks - assuming that you don't have a
MegaSTE/TT/Falcon with a high density drive, you will need to make sure
that any disks that you format and store data from your PC is in low
density format (720k). Any IBM compatible format that matches your drive
density should be readily readable on your ST. If you choose to format
the disks on your ST, you may run into trouble depending upon which
version of the operating system that you have (since the earlier versions
-pre 1.4- didn't format totally MS-DOS compatible). If this may be the
case, you can always get one of the programs such as PC-Format or
DC-Format - both of which shoud be able to format MS-DOS/Atari readable
disks.
Good Luck

>I will be surprised if you are not left-eyed.

Nope, sorry, I'm left-eyed (I found this out years ago after reading a
Desmond Morris book!) and I can see all 3d-type pictures perfectly.
(I've accumulated SIRDS type pictures, double-pictures, etcetcetc)
Maybe you're over-focusing? I have a tendency to do this, as my eyes
are _way_ too used to focusing on dual-image type 3d-pictures (I
hesitate to say the word "stereogram")

In brief, being either left-eyed or right-eyed shouldn't make a diff.
Or maybe I'm an exception...naah! :)
Btw, so what if you see it reversed? You aren't "blind" to them if you
can see them at all!!

Hope this helps...

>computer monitor???).

Hmm, what full-motion video have you seen on CD ? Do you mean the Philips CDV discs for the CDi system ? I've seen several titles on CDi (CDV) and it is really very good ! TV in RGB mode, sound passed through a Dolby Prologic System and it's almost like the real thing... :-)
Remember that on an Compact disc there is 'only' about 650 Megs of data and they put over 70 minutes of audio and video in this space, quite an effort I think !! Another vote in favour of CDV is that with normal use the disc will last about forever, no streaks, no dots, just picture.. compare that to the 'poor' quality of VHS magnetic tape... Maybe with IBM's latest invention (10 layers of CD data on top of each other) we can have Super High res films with 18 bit audio (four channels of course :-) Just have to buy that 31" SXVGA monitor 3600x2025 (16:9) at 120 Hz or so.....

It's the copying of memory instead of just writing the output to
stdout, which prevents that ANSITerm can profit from the efficiency
of /dev/fasttext.

> For me and the users of ANSITerm, XYZ works just fine. I couldn't find
> anything that met my needs better.

You're not using MiNT. :-)

Cyber Paint was on the January 1993 (issue 9) coverdisk for Atari ST Review
(and there are some brief instructions on how to use it as well). If all
else fails, you should be able to order the back issue from ST Review,
or perhaps you could find someone willing to sell their magazine. Cyber
Studio 3-D came with the previous month's issue, BTW.

Of course, you would probably rather have a copy with full docs. Good luck!

Great Atari ST games & stuff for sale!

GAMES:
For $4/each game:
Deep Space, Obliterator, Terrorpods,
Mr. Heli, Forgotten Worlds.

For $10/game
Wrath of the Demon (enhanced colors for STE), Awesome,
Wanderer 3-D (3d glass included, a real virtual world!).

Compilations (3 or more games per package! what a deal!)
"World Beaters"--Outrun, Gauntlet II, 1943, Street Fighter-- $10
"Sega Master Mix"--Super Wonder Boy, Turbo Outrun,
Crack Down, ThunderBlade, Dynamite Dux---------- $10
"Triad II"--Menace, Tetris, Baal---------- $10
"Triad III"--Speedball, Blood Money, Rocket Ranger---------- $10

EMULATORS:
Spectre GCR (MacROMS included) v.3 ----------$150
(complete, box, manual, hardly ever used!)

FLOPPY DRIVE:
Future Systems' double density GTS-100 3.5" drive with LED
track indicator----------$65

MISCELLANEOUS ST STUFFS:

The RIPPER cart.....$28
(break into any program, get a screen snapshot, etc, etc!!!)

BACK-UP your copy protected games with:
TURBO BLITZ (software & cable)----------$10
SYNCHRO EXPRESS (software, parallel port cart & cable)-------$20

BOOKS:
The Atari ST Book by Ralph C. Turner.....$6
Turner's 3rd book of Atari ST Topics by Ralph Turner.....$6

buyer pays shipping
Prices in US dollars

Interested? please e-mail me! :)

>
>Yes, I believe it actually helped in convincing MicroProse in the UK to do a
>port of Civilization and Formula One Simulator to the ST.
>

Hmmm. You know, I bet the MicroProse version of Civilization could easily
be converted to the Jaguar. The code is already there. The graphics take
advantage of the Falcon030 so the graphics would look pretty sweet. One problem
of course is that the cartridge would have to allow for several saves,
but then again, it is possible.

Civilization is a game that is great because of its gameplay, not because of
its graphics. Even though the graphics aren't bad!

What do you all think? Even though Civilization would be running off of the
Motorola 68000 in the Jag, could it be possible?

>got one portion of my problem working since I posted the message, but I
>cannot read the paddle positions from locations &HFF9211 and &HFF9213.
>Any hints, anyone?

Which version of GFA-Basic do you use ? I can't remember having problems
with GFA's peek command.
If it really doesn't work try this:
take an assembler an assemble this as an include file
(for example if you use TurboAss, assemble as GFA-Inline):
peek: move.b $FF9211.w,D0 ;get byte $xxxx9211
rts ;return to sub $4E75

if you got GFA-Basic 3.xx try the following:

INLINE peek%,6

load the assembled peek programm into the inline mem

print XBIOS(25,l:peek%)

xbios(25) should be supexec(), but I'm not shure about that.

If you got the code for move.b $FFxxxx.w,D0 you can easily change
the address by changing the second word into the addresse:
something like this:
WORD{peek%+2}=$9213

|>
|> Basically what they would like to know is:-
|>
|> 1. What processor(s) does the ST use?
STs use 68000. TT/falcon uses 68030 with optional co-pro (68881/68882)

|> 2. Is it in anyway compatable with the IBM PC, or are there any
|> emulators available to allow it to run PC software?
It can read/write standard 720K PC disks. TT/falcons/Mega STes can generally use
1.44 PC floppies. You can buy hardware emulators for 8086 to 386SX.

|> 3. What is the operating system like, is it a GUI?
GEM - A forerunner to WIndows and IMHO muchnicer to use the modern Atari desktop
is much better than the Windows 3 IMHO.

Well, don't put words in my mouth! I think software-based
(Cinepak, etc.) and hardware-based (MPEG-1, which is what
CD-i's digital video cartridge uses) is pretty impressive,
but so was PITFALL on the 2600! <grin> I just won't get
too excited about it until it's much better than VHS
quality -- right now, I'm not willing to trade picture
quality for media life (the only real benefit for CD-FMV).

>Face it, Dave Small is a FLAKE!

That's a rather unqualified and unfair statement to make. He's
had his son almost killed in an accident within the past several
months, with a LONG recouperation time involved and, due to said
incident, got terribly backlogged in responding to customers and
getting everything back in order.

He's also been dragged into some legal fiasco that's chewed up
a good portion of his time.

Spectre 3.1 is now, I believe, in the latter stages of
beta-testing and he's still working on Falcon-compatibility and
possibly even minimal color support (16 colors, which is all
the 128K Mac ROMs support).

598. HP scanjet device driver wanted

Newsgroup: comp.sys.atari.st
Date: 1994-07-12 10:37:48 UTC
From: brendeke@nlsw03.anl.alcatel.nl
Message-ID: <1994Jul12.103748.14581@bln.sel.alcatel.de>
Source record: 183843

Hi there,

I have a little question concerning a HP-Scanjet.
I bought it second hand, and are checking if it works. BUT, to control
with my ATARI I need a device driver. I know it is available with some
software apckages, like Cranach (?) studio. However, as I'am not sure the scanner still
works, I prefer to test it before buying any software for it. So, is there any body who has
such a driver for me, home-made/shareware/...?

I would also like some more information about Cranach (studio) and other software that runs
on a ATARI and can control a HP-Scanjet.

Please respond by e-mail.

Thanks,

```

Since you're talking about upgrading, could you describe what original Link owners need to do to upgrade to the Link II? I read in Current Notes that the upgrade costs $40, but it didn't describe the procedure necessary for upgrading - do we send the original Link & disks in, or just proof of ownership?

If you could let us all know how to handle this, I'm sure I won't be the only one who will appreciate it! Thanks....

600. Re: Why doesn't Flop_fix work for me?

Newsgroup: comp.sys.atari.st
Date: 1994-07-12 12:32:11 UTC
From: s002893@YPSERV.rz.fhtw-berlin.de
Message-ID: <2vu2gb$c8r@RW320B49.rz.fhtw-berlin.de>
Source record: 183846

I do not know. I think you do not use a German TOS2.06.
Because I have no other versions than the German one,
I am not sure that they have the equal beginning (the
first $8000 bytes or so). It is not impossible, that
the ICD-pro-driver does some things which flop_fix does
not like. I have only the "normal" ICD driver (and not
the most modern version).

Today or tomorrow I will test flop_fix on a German TOS2.06
again. I know no reason why there should be now an bug,
but ...

Would you be as kind as to test it on your machine without
the ICD-pro driver?

If it should work on my TOS2.06 and not on your machine
(without the ICD) then there must be a difference between
the Language versions of TOS2.06. If I get other language
versions of TOS2.06 I will try to improve flop_fix.

Greetings, HS

Personally, I think it would be great to start up some new, more specific newsgroups ... right now, c.s.a.s. is being used for everything not programming related ... (and even occasionally, programming related). c.s.a.s.t is mostly about hardware and programming ... and the new c.s.a.a. is a good idea. (Well, for us programmers it is. :-) I'd like to see some dedicated for games, for programming (specifically), and so on. It would make things a lot better, IMHO, and a lot easier to find out what you're looking for.

From: cherborth@semprini.waterloo-rdp.on.ca
Message-ID: <H.eg.nN6k&tcaa7k@semprini.waterloo-rdp.on.ca>
Source record: 183457

How can I use multiple phone numbers for one UUCP site in Hermes? My current site seems to be experiencing some problems on one line, so I'd like to add the other line to my setup while keeping the old line as the "first choice" in case things clear up.

I'm a leaf site, and only call one site upstream, if that makes a difference.

This is untrue. The most colors the 128k ROMs support is 8 (3bit)! If Dave
want's to do more colors than this he will have to write special software to do
it (this is, I understand, how one of the Amiga emulators works...)

|-! -David Butler- dhbutler@magnus.acs.ohio-state.edu

"To my mind the most frightening book ever published is Lewis F. Richardson's
'Statistics of Deadly Quarrels'. You've probably never heard of it even though
its relevance to the mess you're in is at least as great as that of Darwin's
'On the Origin of Species,' which you learned about in fourth grade. And that's
because it's so completely terrifying only those 'experts' who are adequately
armoured with preconceived contrary ideas which will enable them to disregard
Richardson's work completely ever get to study it."

: > anything else that just copied memory to scroll.

: It's the copying of memory instead of just writing the output to
: stdout, which prevents that ANSITerm can profit from the efficiency
: of /dev/fasttext.

What does fasttext do? ANSITerm uses its own 4x8 screen font, so it can't
send to stdout. There's no way to configure the system to do that on an ST.
And the REGISTERED version of ANSITerm doesn't copy memory (most of the time)
to scroll the screen. It uses the hardware.

Where does the efficiency of fasttext come from?

: > For me and the users of ANSITerm, XYZ works just fine. I couldn't find
: > anything that met my needs better.

: You're not using MiNT. :-)

A user of ANSITerm isn't expected to use MiNT. Although I still use ANSITerm
on my Falcon because I can't find anything to come close to the speed,
ANSITerm wasn't designed with the Falcon in mind, and there are a few terminal
programs for the Falcon that do 16 color ANSI.

608. Re: 3D stereogram things

Newsgroup: comp.sys.atari.st

: MM> tried to help me to figure out how to see it right, but I just
: MM> couldn't. As a result, I'm blind to all these stereograms that I'm
: MM> so facinated by. And I'm not just talking about STIS stereograms...
: MM> i see them all backward.

: To which Jeff Kovach replies...

: Do you know if you are right-eyed or left-eyed? Most people are right-eyed,
: and I would imagine that this type of stereo image could be affected by which
: eye your brain favors.

I had strabismus for quite some time which was later corrected surgically.
Before that, I would use my left eye to see things while my right eye I would
try to ignore because it was pointing inward to much.

: To determine whether you are right or left-eyed, look at an object in the
: distance. Then, extend your arms in front of you and form a triangle with
: your hands, using your thumbs as the base. Position the triangle so that
: an object in the distance is in the center of it. Then, close one eye.
: Open it and close the other eye. You will find that they object will remain
: in the triangle for one eye - this is your favored eye.

I tried this. When I close my right eye, the view in my left shifts a little,
and shifts back when I open my right eye. When I close my left eye the view
in my right eye shifts dramatically (although not entirely out of the frame),
and when I open my left eye, it takes a moment to shift back and reallign.

: I will be surprised if you are not left-eyed.

Since I am (apparently) left-eyed, what can be done to STIS to correct for
this?

609. UMS II on Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-07-12 16:48:13 UTC
From: sccoe@ucscb.UCSC.EDU
Message-ID: <2vuhgd$p0g@darkstar.UCSC.EDU>
Source record: 183753

It works! And it's actually playable (unlike on a super slow ST).
The trick is having Warp 9 installed so the pattern-fills work (otherwise
you get the infamous white-screen problem). So use Warp 9, ST med-res,
you must boot up off your Hard Drive but PLAY OFF the floppies! And it
works fine, much smoother and quicker than the ST.

Now we need some good scenarios. I have one extra one (Freedonia), and
I'm working on a fantasy-one. Anyone else out there have any good
scenarios?

Does "flake" mean something much more insulting in other parts of the
world? I would describe Dave Small as a bit flakey just from reading his
Spectre manual. The long delay for 3.1 could reasonably be described as the
actions of a flake, even if there are a whole strings of plausible yet
fantasic reasons for it (that in itself would be somewhat flakey).

I find that Before Dawn does occasionally do funny things, though I suspect
it is the fault of the current application rather than Before Dawn. For
example, PageStream does not seem to like it when BD is activated the
second time. CoNnect, on the other hand, works perfectly with BD. My system
is a MegaSTE with no video card.

> Thanks in advance for your help.

You might try booting it with a 50mHz booter program. With PopII, there does not appear to be any physical copy protection on the disk (just the "look up the funny face in the manual" stuff). So, you can copy the game to a fast-formatted floppy disk, or even your hard drive (though I have not been able to get it to work). Anyway, there are numerous programs that you can run (or include in the auto folder of the floppy) that can switch the machine to 50Hz. This should make it look like a "PAL machine". Check out the index file on atari.archive.umich.edu for exact file names. Feel free to send email if you get stuck.

BTW, it is an awesome game!

615. Please help the novice!

Newsgroup: comp.sys.atari.st
Date: 1994-07-12 19:14:35 UTC
From: hvu@bnr.ca
Message-ID: <HVU.94Jul12151435@bmtlh207.bnr.ca>
Source record: 183760

After successfully getting a few files from umich.atari.archive
on to a diskette for my Atari (that took two weeks), I hit a
brick wall: how do I run the arc602.ttp program to unpack the files?

Here is what I got:

arc602.ttp
stinvadr.arc

I thought just opening arc602.ttp will un-arc stinvadr.arc for me.
It turns out arc602.ttp requires parameters. Unfortunately, the
help screen of arc602 scrolls by so fast, I could never read it.

So please help me. What should I feed arc602 as parameters to
un-arch stinvadr.arc? Am I using the right program to un-arch?

Thanks

Hi Doc,

in germany we have a thing called TEMPUS-Word, ist THE word processor
over here. But I don't know whether you get that stuff in your state.

Try "h" or "-h" as parameter (usually means "hold screen" and wait for key)
Extract usually is "-x" or "-e" followed by the archive name

I think this is the closed-loop floppy Verbatim developed some years ago.
Does anyone know if this works on an Atari? If so, then this could be a
useful device at this price.

]From: bblind@crash.cts.com (Bruce Lindmark)
]Subject: 19 Meg SCSI Floppy Drives $79.00
]Organization: CTS Network Services (CTSNET), San Diego, CA
]Date: Mon, 11 Jul 1994 17:31:27 GMT
]
]I have obtained a Verbatim 20 Plus, which is a 5.25" floppy drive that
]uses a high capacity hard shell disk. This drive is fully scsi compatible
]and will connect to any daisy-chainable scsi device, such as the apple
]scsi card, high speed scsi card and the Ramfast card. The disk formats to
]19.1 meg on an Apple IIgs and Quantum lps 105. In a Mac chain it formats
]slightly higher. This is a perfect back-up device for disk image
]back-ups, or as a large capacity removable media boot device.
]
]The Verbatim 20 Plus is available from Memory Plus Distributors Inc. of
]Scottsdale AZ for $79.00 plus shipping and includes a 25x50 scsi cable,
]terminator, power cable and one (1) disk. Extra disks are available.
]
]MPD inc, states that this is a close out sale and when the present stock
]is sold out there will be no more offered. Time is of the essence on this
]item.

INTERNAT. ATARI POWERSHOW FREIBURG INTERNAT. ATARI POWERSHOW FREIBURG

Sorry for the late notice, but we were quite busy during the last few weeks,
and no one was able to translate this... I hope we're no TOO late...

---> what is it?

A T A R I P O W E R S H O W I N T E R N A T I O N A L
==

---> when?

Date: 23. + 24. Sept. 1994 10 - 18 o'clock

---> what can we expect?

Our main objective is to show what's possible with Atari computers
these days and in future. We want to provide informations to users,
developers and dealers in order to help them in their decision to
keep up their support for and use of Atari computers.

We want to offer a chance for the "Atari-world" to meet; get new
contacts; test, sell, and buy products; spread the latest gossip;
and so on.

Visitors will have the chance to buy and/or order stuff on the show
(depending on the attending companies).

This worked quite well last year - this year we have more
rooms, and hopefully a bit more publicity.

---> who's doing it?

A K A (Anwender Kreis Atari) Freiburg

The AKA is a collection of professional (most of them) Atari users
who meet on a regular basis since 1985, now included Atari-System-
Dealer and Atari-System-Service we trust in !

We don't want to earn money with this. We would be very happy to get
our expenses in, though :-)

We're doing this because Atari-users need competent
partners and a secure base.

---> responsibility?

Werner Laass Neumattenstr. 12 D-79102 Freiburg
Tel + Fax: +49-761-34483

email: werner_laass@traveller.fido.de

---> costs for exhibitors?

For hard- and software-developing companies and distributors, we
think of about DM360.-- for both days (tables, chairs, energy,
insurance included, but you should bring your own advertising media).

For developers without financial reserves: DM30.-- !!

If you don't have the possibility to come to the show, but want your
product to be presented, contact us (but our resources are limited)!

If you're "just a user", but want to show what YOU are doing with
your Atari anyway - you're welcome!

---> Costs for visitors?

DM4.--

---> Where?

Fachhochschule fuer Sozialwesen
Bugginger Str. 38 79111 Freiburg

---> how to get there, Hotels etc.?

mail us, we'll send a plan & information!
(fax or phone to Werner Laass, see above)

---> who has been invited yet?
("!" = will come, ">" = will send stuff, "?" not shure yet, but want
to do something, " " = no reaction received -> holidays in Germany)

Well, given that, I could very well agree with you. :) But I hardly think the original poster's comment was meant to be humorous, only denigrating.

>The long delay for 3.1 could reasonably be described as the
>actions of a flake, even if there are a whole strings of plausible yet
>fantasic reasons for it (that in itself would be somewhat flakey).

All too true, I suppose. It _has_ been an exceptionally long wait, but at least I don't know of anyone who has been cheated out of $$$ from Gadgets. Now THAT would be truly flaky behavior, IMHO. Whatever...

You have the right archiver, alright. To decompress the file, put
ARC602.TTP in the same directory as STINVADR.ARC and run ARC602.TTP
by double-clicking on it. Then on the command line type:

xh stinvadr.arc *.*

This will extract all files in the archive to the current directory.
'x' means extract and 'h' means hold screen until you hit a key.
Using the 'h' option also helps when you want to view the help screen.

If the Arc utility is not in the same directory as the file to be
acted on, then just add the appropriate path on the command line.

Even better, however, is to get hold of one of the many program shells
for ARC, LHARC, et al that eases the process considerably. There are
many shells available but ARCSHELL by Charles Johnson (of CodeHead fame)
is one of the better ones. It's shareware and should be available via
ftp from multiple sites.

623. PGP Shell v0.9 released

Newsgroup: comp.sys.atari.st
Date: 1994-07-13 00:31:46 UTC
From: renfro@bnr.ca
Message-ID: <2vvcli$des@crchh610.bnr.ca>
Source record: 183764

Version 0.9 of PGP Shell has been uploaded to atari.archive.umich.edu
and should be available soon.

This version has been tested with PGP2.3a, but I understand there is a
ver. 2.6ui floating around Europe. If someone could please check for
any compatibilty issues and send me feedback, I would appreciate it.
I am also trying to get a hold of this new version.

Note that this will be the last version that will be distributed as
fully functional shareware. Any future versions will be partially
disabled and require a key code to fully activate. Anyone who registers
this or previous versions will receive a key code when the next
version is released. If you use the program, please register and let
me know you would like to see it further developed. Please see the
README file in the distribution package for details on how to register
in North America or the United Kingdom.

I am still looking for anyone interested in translating the resource
file and/or the documentation to German and also to collect registration
fees in Germany.

Thanks,
Randy

PGP Shell Revision History
==========================

*Changes in v0.9 (06/94)
- EXECUTE button in GEN KEY dialog left selected.
- ASCII file view crashes when file same size as screen.
- File paths now passed to PGP.TTP.
- New key management dialog with more commands.
- Quick commands implemented.
- UserID selector implemented.
- Key sequence in quick cmd to call up file & userid selector.

>Can some one tell me why Papyrus looks like a Copy of Script..??

looks like we were inspired by the same program, i.e. WriteNow on the Macintosh

>So Please give me the Real thing and not a Copy...!!!

So get a Mac. ;-)

Honestly, I think making things like the ruler that work the same way look
the same way is only convenient for the users. But have you checked the things
that work differently, like arbitrary zoom in papyrus, background printing,
modeless dialogs (papyrus had them before Script), easy Speedo font handling,
powerful picture handling, arbitrary page layout, really easy^C

OK, OK, i'll stop, you don't like too much advertising here. But I really had
to answer this.

>created for Atari computers.. It, however, does have its limitations:
>
>1) It needs a fast machine (Mega-STE/Falcon is a minimum, when using Speedo
>fonts, I think)

I'm happy to say that this is no longer true. Since the brand new version 3.5
papyrus has a built-in Speedo Cache that makes Speedo output on the screen
as fast as bitmap font drawing and also removes line flickering while
typing. A 8 MHz machine is now fast enough for papyrus+Speedo with no
noticable delay between typing and drawn letters.

>(demo has some problems with
>Geneva, however..)

I heard about that, but couldn't get hold of Geneva yet.

Christian

: > anything that met my needs better.

: Is XYZ.ttp still being developed? The last version I saw was years old.
: GEM SZRZ 2.28 can blow it out of the water, as can CoNnect's internal Zmodem
: (from a speed standpoint). I hear that the registered GSZRZ 4.x versions
: are even faster. What is the newest version of XYZ you have seen? I seem
: to remember a 2.2beta or something like that (being the last version)?

That's the last version I have and the last version ANSITerm supports.
Contact the author if you want more information.

: You should be able to use GEM SZRZ in place of XYZ in most cases, as it
: supports the same secondary text file batch format. I suggest you give it
: a try. I'm sure the significant additional speed, coupled with the much
: nicer and more informative user interface would be welcome additions to
: Ansiterm users.

ANSITerm development has also stopped. There are countless peope who use it,
but under 40 have actually registered it. They don't know what they're
missing because it's got some neat new features... and it's lots faster.
Anyhow, it's only $15, and if I saw that there was actually a demand, I would
continue development.

Where can I get this GEM SZRZ?

Would you like me to post the additional features list for version 1.91?

637. Strange bugs on ST with HD

Newsgroup: comp.sys.atari.st
Date: 1994-07-13 08:21:35 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <30086f$frr@m1.cs.man.ac.uk>
Source record: 183452
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've been battling with this one for a couple of weeks now... but can anybody explain why ST's with TOS 1.2, 1.4, 1.6 or 2 should lock up completely inside certain read() calls (GEMDOS function $3f)? The same routine is used in a couple of different places, and works at one part but not at all at the other. If the same program is run from floppy, or on any other version of TOS, everything is OK. If you have a non-Atari HDI driver then instead of locking it can bomb instead.

Could anyone also explain why a program that works fine on 2M STe's won't work on some 4M STe's despite not making any different use of memory?

Dave

640. Modem speeds.

Newsgroup: comp.sys.atari.st
Date: 1994-07-13 08:53:07 UTC
From: daveh@netcom.com
Message-ID: <davehCsvFCJ.9oy@netcom.com>
Source record: 183786

What modem speed should I expect using the following configuration?

Atari Mega ST2 and Practical Periferals PM14400FXMT modem. I have HSMODEM4 installed aparently linked at, 19200 DTE, 14400 DCE with V42bis enabled. When I download with Connects internal ZModem with no multi tasking everything else idle. I get about 1600cps, is this reasonable?

Is the above modem reasonable? I can still change it for a US Robotics Sportster if it is any better (they are about the same price.)

Now onto Connect, is there any way to make it respond faster? It's reasonable with the Gemini font, GDOS1.1 and Turbo ST but not as fast as a TOS terminal program like uniterm (To be expected I guess.)

I really don't understand what parameters I should configure the HSMODEM with. Connect says I have an RSV cookie although I have not done the RSV hardware mod and I think I responded No to the install RSVE cookie option on HSMODEM setup. Even though the RSV cookie is present Connect does not offer higher baud rates (just as well since I havn't actually done the RSV mod.) Some more pointers to how I should configue this beast would be usefull.

Many Thanks,

Dave Halliday

I have a STE with a GE-soft controller and a 40Mb Quantum SCSI drive. It's
been working fine for a year or two. Last weekend the data on the drive
started to corrupt. I finally reformatted the drive after several attempts.
It's been OK for a week but last night the data was corrupted. Both days were
very hot in the room where the ST is. The drive, a commercial unit, has no
fan. Is it that simple? Or is there another problem someone has come across?
Any heap appreciated
Cheers
Stephen Bennett

OK, I admit, I wrote the flame below. It WAS somewhat insulting, but I was hoping to get a rise and response out of Mssr. Small, since my efforts at some very basic customer support for his complex device were in vain. Even the retailer who I bought it from, B&C Computer of Santa Clara, CA, did not get as much as the courtesy of a reply from continual mail, E-mail and phone requests for just some basic technical support. This was pretty frustrating, since I paid good money and in good faith for Spectre GCR 3.0 (and the ROMs it requires). While I don't think Mssr. Small is a crook, I have heard tales on this network of him neglecting basic business practices that have led to one customer, at least, filing complaints to the Colorado Consumer Affairs office. Then, after all the "hoopla" about Spectre 3.1 last year on GEnie, we hear nothing. Admitedly, he writes in a very "stream of consciousness" style in his manuals and network posts that endears him to some, but can be quite frustrating to the less than technically oriented. Atari users were at one time a source of income for him, and he has done a lot for us, but if it takes a little flame to rouse him to address us on our concerns, so be it. "Flake" should be taken to mean "eccentric," rather than intentionally unethical. But I do not think it unreasonable to to describe the business practices of Gadgets by Small as "flakey." ---Annonymous

> Where can I get this GEM SZRZ?

Atari.archive.umich.edu in /Telecomm. Several other telecomm packages
support GEM SZRZ directly, either in its accessory form or as an external
executable. It is a shareware program, still being developed (to my
knowledge).

> Would you like me to post the additional features list for version 1.91?

Sure. Might I suggest that you prepare a demo version of your program, with
the fast scrolling you describe? The newest batch of modem programs
concentrate more on compatability than speed, which is good for folks who
own faster machines. However, the best choice for UNIX modeming (IMHO) for
8mHz machine owners is still Uniterm, due to its speed. I think that a
super-fast scrolling telecomm program that supports Zmodem directly (which
Uniterm does not) and perfect vt100 would be popular. You might disable some
other features to encourage registration, but the fast scrolling is what
would probably sell the program (and should therefore be included in the demo,
again IMHO). Just my $0.02.

Actually, I meant the reply that was quoted by Steve (which did appear to exist :-). Someone sent it to me, so I have now seen it.

> This chap owns all the rights to Zmodem from 1987 onwords, they should, he
> invented Zmodem....

Ok. This does not change the _fact_ that Zmodems that can do wildcard downloads are a dime a dozen on _most_ Internet systems. UNIX systems, which make up the vast majority of Internet connection points, and with which I have some slight experience, have lots of Zmodems that work fine, and are publically available. I have no doubt that you are right about the behavior of Zmodem on your system. I'm simply stating (and citing examples) that it is not typical behavior.

Rog, all I'm trying to suggest is that when you give your standard advice about STorm's wonderful Zmodem, please qualify the statement. For example, "STorm's Zmodem works for me when others didn't, YMMV" or something like that. I can state from experience that most users will not have the same Zmodem problems that you did. Just my $0.02.

With v3.0, one must have the "Turbo SCSI" option turned off if any of the
ST296N is used as Spectre disk space. The ST296N has an interleave of 2:1
for most Atari host adaptors (I heard that there was one that could use this
drive 1:1, but I cannot confirm that). Other than that, it should work.
Note that "Turbo SCSI" used to be "Slow SCSI" in older versions of the
Spectre software, with the meaning of the selection reversed.

I have a ST296N, but it does not have any Spectre partitions on it. I use
Syquest cartridges for Spectre with Turbo SCSI on, and it works fine (and
fast). This is on a Mega2ST and MegaSTE.

Nope. All the Populous II versions are like this. That's why they include
the CHANGEHZ.PRG utility on the disk, although the confusion is warranted
as their was no reference to it in the docs in my package.

I just wish it ran a little faster on my Falcon. It's fun but slow...

Ah, yes, I remember it well from when I lived in Australia. While their 'Chocolate Flake' is good, my personal favorites are 'Cherry Ripe' and the ever so popular 'Crunchie' bar. But for non-chocolate tastes, ya just can't beat a bag of 'Minties.' :)

That reminds me... I'm about due for my semi-annual 'care package' that mates in Oz send me full of the goodies I can't get here in the states. Hope it arrives soon as all this talk has my mouth watering again. :)

> reasonable?

That was exactly the configuration I had a few months ago, and I got about the same CPS you did (slightly higher, perhaps due to bigger serial buffers or NVDI). I have also gotten about the same speed with other modem programs on other platforms. It appears that ~1600CPS is about as good as v.42 can do with compressed .lzh/.zip/.arc/.zoo files. I have gotten slightly better speeds on PCs with 57600 line speed capability, but no more than ~100CPS more (and it fluxuates).

> Is the above modem reasonable? I can still change it for a US Robotics
> Sportster if it is any better (they are about the same price.)

There is a hardware bug on the FXMT that prevents it from connecting correctly with Telebit Trailblazer modems (used on the Netblazer annexes). It will connect at MNP-5 instead of v.42, which sucks! I called PPI, and we analyzed the problem. They were not sure a firmware fix could be made (i.e. new ROM chips), so they agreed to send me a 14400FXSA (the cool one with the backlit LCD window that flashes status messages at you). At the time, this modem cost more than twice what the FXMT did, so I considered myself lucky :-).

If you don't have to connect to Trailblazers, the modem works just fine. I used mine for a few months, and connected perfectly with a whole slew of different types of modems with no problems. It is likely that part of the problem is on the Trailblazer end, so I would not take what I said above as a "chuck it" for the FXMT.

I have also worked a bit with the USR Sportsters, and did not have any problems.

> Now onto Connect, is there any way to make it respond faster? It's
> reasonable with the Gemini font, GDOS1.1 and Turbo ST but not as fast
> as a TOS terminal program like uniterm (To be expected I guess.)

NVDI will help a whole lot, but Uniterm is still faster. For raw speed, it is very difficult to beat the TOS style character graphics with a GEM window (on 8mHz and 16mHz machines, at least). On my MegaSTE, the difference is slight between Uniterm and CoNnect, so I sacrifice a bit of speed for

the additional features and nice user interface of CoNnect. On an 8mHz
machine, I would use Uniterm coupled with Gem SZRZ for Zmodem downloads.

> configue this beast would be usefull.

It takes a few tries (with docs in hand), but it is not too bad. You can
check the configuration with setter.ttp as well (just don't save the settings).
I seem to remember that I bumped up all the serial buffers slightly, and set
the cookie variables and such as suggested by the manual.

> fan. Is it that simple? Or is there another problem someone has come across?

It could be heat. I have had drives go weird on me when A/C failed. Even
a fan is not enough when the temp gets high enough. Of course, it could be
a million other things, but I would try putting the drive in a cool
environment and seeing if the problem persists. Oh, when you move the drive
to a cooler place, let it adjust to the temperature in the new location for
a few hours before you spin it up. Radical temperature changes can
definitely do bad things to drives, as the components expand and contract at
different rates. I have worked with disks (huge SMD oldies, thankfully not
popular any more) where one had to wait 24 hours for them to adjust to a
new temperature. Hope that helps.

659. MegaSTE 16mHz booting

Newsgroup: comp.sys.atari.st
Date: 1994-07-13 17:57:33 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <3019ud$pbd@mailer.fsu.edu>
Source record: 183704

I have grown to really like playing games in 16mHz mode on my MegaSTE. It really makes some games MUCH better than they are in 8mHz. I have a question about booting in 16mHz mode.

There are a few programs that allow you to do this with games that have an executable boot sector. The one I use is called booter, and I have a disk with this program in its auto folder that I use to boot games that fit the bill (it runs, asks you to switch disks, and you press a key). This program is on atari.archive.umich.edu in /Ste/Mega, BTW.

However, I have some games that do not have executable boot sectors, but instead run from the auto folder. I hesitate to add a 16mHz switcher program to the auto folder, as it might mess up the copy protection on the disk. By the same token, I hesitate to write an executable boot sector to such a disk (like a "virus free" boot sector) for the same reason.

It occurs to me that the perfect solution would be an executable boot sector that switches the machine into 16mHz, then waits for a keypress. The user would switch disks at that point, and when the key is pressed the boot continues. Even better would be to have the program check for another executable boot sector, run it if it exists, else continue the normal boot (which will go to the auto folder, etc.). This would provide MegaSTE users with one disk that can boot any floppy in 16mHz mode.

My problem: I don't know beans about writing executable boot sectors :-). Can someone tell me if this is feasible? Someone want to do it?

660. Hard Drivin II

Newsgroup: comp.sys.atari.st
Date: 1994-07-13 18:05:14 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <301acq$pbd@mailer.fsu.edu>
Source record: 183705

This game does not like TOS 2.06. It appears that a fairly common copy protection scheme uses bad sectors in track 0, which older TOS's ignore but TOS 2.0x will not allow. For this particular game, however, I have found a trick to get it to work. To do it, you need to copy all the files from the disk onto another standard formatted floppy. This is hard if you only have a TOS 2.0x machine, but you could probably make a disk copy of the disk and have it correct the bad sectors on the copy. Then, boot the new copy of the disk, and run harddriv.prg (HDII uses regular files on the disk, which makes the trick work). When the screen displays the first "Hard Drivin II" credits screen, pop out the disk and stick in the original. A disk error will occur, with a "retry cancel" dialog box. Swap disks again, and hit return. Poof, it'll work. It also works in 16mHz mode.

This is a pretty good game, BTW. It differs from the first Hard Drivin in that you have multiple tracks, have the ability to create new tracks, and you can null-modem two machines together and race head-to-head (the real reason I have been working on this!).

661. Vroom and Formula One

Newsgroup: comp.sys.atari.st
Date: 1994-07-13 18:09:19 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <301akf$pbd@mailer.fsu.edu>
Source record: 183706

I have developed an interest in racing games as of late. I have heard of three cool ones, and wanted to solicit opinions from other gamers.

Vroom - made by Ubisoft, who generally do a great job. Screen shots look good :-).

Formula One Grand Prix - made by Microprose, I have seen it refered to as the best for the ST.

No Second Prize - motorcycle racing, 3-D solid polygon graphics, have seen one good review.

Can anyone comment on the above? I don't want to buy all of them and end up with two that suck. Any known bugs? Works with TOS 2.06? Works at 16mHz? Null modem head-to-head capability? Thanks in advance for any comments.

662. Mega4 ST / hard drive for sale

Newsgroup: comp.sys.atari.st
Date: 1994-07-13 18:22:26 UTC
From: davidli@dragon.labmed.umn.edu
Message-ID: <Csw5JJ.4x1@news.cis.umn.edu>
Source record: 183713

I have a Mega4 ST for sale, asking $300.

I also have an ICD ASCI+ controller card, and a 20 megabyte SCSI hard drive for which I'm asking $125. You'll need to get a case for the card/drive, as it is currently residing in the bottom half of an SH205 case (it works ... there's a power supply and all of the connectors necessary. I've managed to use it this way for a few years, but you may not want to...) :-) I can stuff it with PD/Shareware software if you desire. Let me know if you prefer games, utilities, programming languages or ? (I maintained a user group software library for 4+ years ...)

I also have a color monitor, which I will donate to the person who purchases the Mega4 ... it works fine, but, being over 6 years old, it definitely has seen better days.

Prices include shipping via UPS.

Feel free to give me a phone call about the equipment if you desire. I can be reached at (612) 625-3694. E-mail also works quite nicely!

No, I'm not abandoning the ST ... it's just one ST more than I need at home.

- David Paschall-Zimbel davidli@simvax.labmed.umn.edu

I think there is a problem with any proposal to drop ST from the
newsgroups. The main computers discussed in them is the ST and its
descendants the Mega, STe, TT, and Falcon. They are not meant, in my
understanding, to be forums for Atari 8-bit (or 6502 if you prefer)
computing, which is what they could become under such a reorganization.
Doing this, therefore, would be similar to calling the Amiga newsgroup
Commodore (or whoever ends up with it) or the Mac newsgroup Apple.

Source record: 183623

Does anyone out there know how to contact Bruce Sarte? I struck a deal with him over the net back in April, two days before the machine I was using for net access turned itself into a paperweight (not an Atari). My check was cashed, no merchandise arrived, and I have been unable to make contact since my only copy of both his net and snailmail addresses went up in smoke with my access. He may well have tried to contact me with whatever the problem was, but I was unable to receive it. This is NOT a flame of Bruce (at least not yet), since I can't get to him to ask for an explanation yet. Any help with re-establishing contact will be appreciated.

>And the REGISTERED version of ANSITerm doesn't copy memory (most of the time)
>to scroll the screen. It uses the hardware.

>Where does the efficiency of fasttext come from?

The fasttext driver in MiNT has heavily optimized cursor placement code,
fully optimized 8-bit wide character drawing code, as well as optional
hardware scrolling. I guess it's of no use to you since you use a 4x8
screen font. Perhaps we should add that as an option to the fasttext
driver; it would certainly make the regular screen more useful...

I take it you're also using the color screen resolutions. (Since it's
rather a pain to do hardware scrolling correctly on a plain ST using
an 8 row high font in monochrome...)

Given what you've posted here, it doesn't sound like you need any of the
features of the fasttext driver. [fyi, I wrote the cursor code and tweaked
some of the other stuff.]

Finally something really _interesting_..! Some people want those essential kick, hit, shoot the aliens, use 500 karate moves -games... But I want Civilization.. And Formula One Grand Prix.. And SimCity 2000.....

Yes, folks: SIMULATIONS for Jag _and_ for Falcon-030..!!!

I guess it's simple: if MicroProse, Spectrum Holobyte, Maxis and others think we'd buy Civilization for Jag/Falcons enough - then they'll make them. But right now... I may be wrong, but while people mostly talk about Mortal Kombat style of Jag-games, and not from Falcon-games at all - why on Earth should they think we want any high-end simulations..? The Jag could probably handle Falcon 3.0 flight sim with its fractal landscapes.. Even F-030 might - with help from its DSP. But I feel that most of us, Atari-owners, who'd love such simulators, have already bought a PC. So: will Jaguar remain as a "everyman's coin-op console" -and Falcon without commercial games at all..?

For you, who own Falcon-030: support Silmarils by buying their Ishar 1-3 RPG games (or Transarctica) ! Because Ishars are very fine role-playing games with great 256 color graphics, DSP sound, and _lots_ to do... They are worth _every penny_, so let's show their makers we appreciate their work..?!

675. HELP!!! my NEWDESK.INF file keeps screwing up!

Newsgroup: comp.sys.atari.st
Date: 1994-07-13 23:39:27 UTC
From: cs93294@assn030.cs.ualberta.ca
Message-ID: <301tvf$703@scapa.cs.ualberta.ca>
Source record: 183715

Hi..

I recently made some changes to my setup that required me to save the desktop. Some involved using a text editor (everest, to be precise) to install more than one extension to a single program. I also assigned ALL of the menu functions to keys. When I saved it however, and then started up, my menu selections were all screwed up! When I looked at it with my text editor, I found that the part that assigns keys to menu items had been duplicated!! The offending bug appears thusly in my NEWDESK.INF file:

#K 4F 3F 53 44 46 42 43 57 45 58 21 5B 5D 31 #K 4F 3F 53 44 46 42 43 57 45 58 21 5B 5D 31
32 33 34 30 3D 26 49 41 57 52 50 2E 4D 5A 00 00 56 @

In particular, notice the point where "#K" repeats itself! I fixed it with everest and everything seems to work fine.. except that whenever I save the desktop from the menu, this error appears AGAIN!

Can anyone help me here, it is most distressing. A very pesky bug!

Why stop at FLI's and Hypermedia? Why can't we get Mosaic
running on the ST series of machines? I spent last evening d/ling
for my sons Mac IIsi. This thing is AWSOME! We need it! As a stop-
gap lynx (I think that's the name) line mode WWW browser would be
satisfactory, if we didn't have to mess with learing UNIX to use it!
UNIX? Isn't that the shortened form of the name? ;-)

I guess you are asking for a GDOS-driver wich supports color-printing
with 180 or 360 DPI. Sorry - did never see such a driver.
But if monochrome is ok for you, try drivers for Epson LQ, Star NB15
or NEC P6.

-=-=-=- Includes: Form Letter Example & Electronic Arts Address -=-=-=-

CAIN's A.C.T. Now (Atari Community Together Now)
Jaguar Writing Campaign

Contact: Len Stys (aa399@cleveland.freenet.edu)
A.C.T. Now Organizer
CAIN Assistant Newsletter Editor
Cleveland Free-Net Atari SIG Manager

Notice: This campaign is made by an organization that is independent
of Atari Corp. This campaign is not endorsed by Atari Corp.

Please continue to distribute this as you have with the other campaigns.
Thanks.

A COMPANY THAT SHOULD BE WORKING ON JAGUAR GAMES

Electronic Arts is probably the best producer of sporting games for the PC
and for video game systems in the world today. The company has a number of
popular sporting titles out and these include: John Madden NFL Football,
NBA Showdown, FIFA International Soccer, PGA European Tour Golf,
NHL Hockey '94, MLBPA Baseball, and Mario Andretti Racing. Electronic Arts
publishes great sporting games--it is a fact.

Electronic Arts is also known for producing games like Wing Commander,
Escape from Monster Manner, Twisted, and many more.

It is widely-known in the video game industry that Electronic Arts has been
supporting the format of 3DO since before the first system was sold. This
is because the founder and past CEO of the company started 3DO.
Trip Hawkins has also been known to take shots at Atari Corporation and at
times ignore that the Jaguar was any competition.

The goal of 3DO is to make 3DO the standard multimedia and entertainment
system format. Just like the PC is today. But the Jaguar is faster than
the 3DO and better in some areas. Is it right for one system to be a format
when it is less capable than other systems on the market today?

Recently, Trip Hawkins resigned as CEO of Electronic Arts to concentrate
on 3DO. This is good news for Atari Jaguar owners! It means that
Electronic Arts may be open to producing games for the Jaguar and there

have been rumors that say this is true. Electronic Arts does have Jaguar developing units--they just have to start using them.

GREAT GAMES FOR A GREAT SYSTEM

Electronic Arts produces great games and there is a chance that you might see these great games for the Jaguar if you write the company a letter. If Electronic Arts starts producing games for the Jaguar, the Jaguar's success is pretty much definite. The company supplies sporting games to people that demand sporting games for their system.

The key is to write. If you do not write, nothing will happen.

Electronic Arts has always been known to listen to letters and if there are enough letters sent to the company, the company will seriously consider making games for the Jaguar.

The letter should contain the following:

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your 8-bit Atari (if true) since the company was started.
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to hits high-performance/low-cost.
5) The games that you would love to see on the Jaguar (choose two or three Electronic Arts games).
6) How you believe Electronic Arts' games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games if they produce them for the Jaguar.
8) How you will show your friends what kind of great games EA makes for the Jaguar.
9) A thank you to the person for reading your letter and a thank you for considering producing games for the Jaguar.

The address of Electronic Arts is:

Electronic Arts, Inc.
Attn: Production Teams
P.O. Box 7578
San Mateo, CA 94403-7578

It is important for you to take a few minutes out of your day to write. If you do not live in the United States, please write the Electronic Arts in your country.

I suggest that you write your OWN letter, but you may use the following as an example letter:

FORM LETTER EXAMPLE

(date here)

(return address here)

Production Teams
Electronic Arts, Inc.
P.O. Box 7578
San Mateo, CA 94403-7578

Dear Sir or Madam,

I am writing you to tell you that I really enjoy playing Electronic Arts games. I have played games made by Electronic Arts since I owned my Atari 8-bit computer. I purchased many of your games and I had a lot of fun with them. I have supported your company for a very long time.

I now have an Atari Jaguar and I believe that it is the best video game system on the market today. I believe that it will be very successful in the future due to its low price and high performance.

I would like to see Electronic Arts games for the Jaguar such as John Madden Football, PGA European Tour Golf, and FIFA International Soccer. I would also like to see games like Super Wing Commander, MLBPA Baseball, Twisted, NHL Hockey '95, and Mario Andretti Racing.

I believe that Electronic Arts games on the Jaguar will be unbelievable with the graphics, sound, and speed of the Jaguar. And because the Jaguar will have a Voice/Data Modem, EA can make all of the games with modem and networking capabilities!

I will buy Electronic Arts games for the Jaguar and so will all of my friends that have Jaguars.

Thank you for reading my letter and for considering making Jaguar games. I look forward to seeing Electronic Arts games for the Jaguar in the near future!

Sincerely,

(sign your name)

(type your name)

THAT'S ALL

All there is left to do is write! Can we do it? Yes, we can! Remember that success is... more attitude than aptitude.

Source record: 183747

Perhaps it's not even a bug, or it has already been resolved.
But "getpass" behaves differently than on a Sun:

getpass exits automatically after the eighth character has been entered.
I believe it should wait for an additional Enter.
Also, as I type Enter, I expect this Enter to be echoed to the stderr.

I don't know who maintains these libs.
Hope he reads this group...

Richard.

Isn't .AVI a microsoft file format? If so, it will probably be on their internet site ftp.microsoft.com (I think).

Seems to be a frequently asked question! Essentially, your libraries
are broken. Get the latest versions of the gcc tools and libraries,
and all should be well.

ATARI Happening in Elmshorn/North Germany
-----------------------------------------

Announcement Update 07/12/1994
------------------------------

Computer Club Elmshorn e.V.
ATARI ST/TT/FALCON group
Postfach 261
D-25302 Elmshorn
Germany
Tel. 04121/83298
FAX 04121/82016

This is first the english announcement for the 5th Elmshorner
Computertage from the Computer Club Elmshorn e.V. On 29th and 30th
october is a big systemindependent computer exhibition in Elmshorn.
Elmshorn is a city 30 km north of Hamburg. The ECT has 10000 visitors
on average.

The exhibition are organized by the CCE e.V. and the city of Elmshorn.
The CCE e.V. is one of the biggest german systemindependent computer
clubs.

More than 50% of the exhibitors are ATARI dealers, ATARI clubs, ATARI
software producers and ATARI freaks. It's no PC show, it's an ATARI
happening.

Venue is the KGSE Elmshorn (Kooperative Gesamtschule Elmshorn), the
street called 'Hainholzer Damm'. You can easy reach Elmshorn by train
or motorway. We will put landmaps as IMG images next time in the
BBS.

Exhibition opening:
Saturday 29th october 2 - 6pm
Sunday 30th october 10am - 5pm
- no admission fee

- additional : - big cafeteria
- tombola
(we hope, that we get a FALCON computer
for the tombola, please read our next
updates)
- separate product presentations

ATARI exhibitors on the happening Update: 12th july 94
------------------------------------------------------
```

- CrazyBits, Berlin (PixArt,thermo sublimation color printer,
FALCON's, ATARI hard-/software etc.)

- Betz Computer, ATARI dealer (Medusa T40, GE-SOFT Eagle TT, FALCON-
Tower, ATARI hardware etc.)

- Layout Service Kiel, ATARI dealer (ATARI hard-/software, FFT,
GAL-ED, FALCON, Jaguar etc.)

- Hinsch & Partner, ATARI dealer (ATARI game dealer, Jaguar,
FALCON etc.)

- Computer & Service Kiel, ATARI dealer (ATARI hard-/software,
(DTP, FALCON's, TT's etc.)

- VHF Computer, Schoenaich (Janus ATARI board for PC, Platon PCB
etc.)

- Pagedown, Goettingen, ATARI dealer (Script 3.5, Purix Formula
etc.)

- Jochen Merz Software, Duisburg, (Networks SMS2 realtime operating
system)

- Columbus Soft, Darmstadt (Ergo 1.5 GFA BASIC delevoping system)

- we are negotiated with many other ATARI and
software dealer, please read next updates

- Computer Club Elmshorn e.V./ATARI ST/TT/FALCON group
(FALCON's, TT's, ST's with ATARI applications, demos,
Cubase MIDI, ATARI programmers etc.)

- we hope, that foreign ATARI clubs are in Elmshorn, too !

Additional, we plan a big meeting of ATARI mailbox users with a
restaurant visit on saturday evening etc. Please, contact Ole
Marienhagen for this meeting ideas.

```
* ********************************************************************
* This is the first update of our exhibitor list and the result of *
* the first advertising week for our 5th ECT. I've invited more than *
* 100 hundred ATARI dealers and software producers. *
* We will update this list every week ! *
**********************************************************************
```

This is a message is for all european ATARI enthusiasts, especially for
our dutch, scandinavian, polish and british ATARI friends. Let's have a
big ATARI party and two nice days.

Jens Schulz
Manager of the ATARI ST/TT/FALCON group CCE e.V.

Foreign ATARI computer clubs or ATARI exhibitors are invited for this great ATARI Happening, too.

- no cost for exhibitors (all free)
- CCE e.V. support exhibitors with tables/amperage
- advertising in the german ST computer magazine (12500 exhibition catalogues 16-32 pages)

If you've questions about the exhibition, please contact Ole Marienhagen by EMAIL (marienhagen@tu-harburg.d400.de)

If you will get an exhibition stand. please contact us immediately, because many other ATARI and PC exhibitors will order exhibition place, too. Please, use this registration form for an exhibition stand.

We will send back for the exhibition confirmation and exhibition stand reservation.

Let's have a big european ATARI party.

Registration form for the 5th Elmshorner Computertage

Computer Club Elmshorn e.V.
Postfach 261
D-25302 Elmshorn
Germany

Registration for the 5th Elmshorner Computertage
on 29th/30th Oktober 1994

ATARI-Club/Company : _____

Our address is:

Street : _____

ZIP-Code : _____ City : _____

Country : _____

Telephon: _____ FAX: _____

Please contact Mr./Mrs. : _____

Exhibition stand : Length in m : _____

Width in m : _____

We will show following computer systems : _____

_____

We will show following software products : _____

_____|

Date, City : _____ Signature : _____
Company stamp

Hint : The put up of the exhibition stand will begin saturday
29th october at 9am. The put up will be supported by the
CCE e.V. The exhibition stand is free of any charge. We
hope, that you've something for our great tombola. Don't
forget an insurance policy for your hardware equipment.

Source record: 183734

ace@ars.ath.forthnet.gr wrote:

: Do you know any ftp adress for downloading ST programs via internet??
: Thanks
: ACE

Erm, loads

micros.hensa.ac.uk under micros/atari/

(of course this address will come first if I reply ;->)

You may find it easier to use this site with gopher, and WWW. In the
case of WWW, use the address http://micros.hensa.ac.uk/

Other sites:

atari.archive.umich.edu

or a site which mirrors this: src.doc.ic.ac.uk

also:

ftp.cs.ruu.nl

ftp.funet.fi

ftp.cnam.fr

ftp.uni-kl.de

ftp.uni-erlangen.de

These are to get you started off.

If you want more, then a list is available from micros.hensa.ac.uk, and
is updated frequently. You may grab it under the path:

micros/atari/tos/n/n168/ftplist.txt

or you may browse a list from the Atari WWW pages at HENSA. Address
above.

Hope this helps.

Regards
Danny

> RSVE cookie option on HSMODEM setup.

Why do you not write the whole message of Connect and instead of that you
forget a (the last) character???????

I am sure that Connect finds a RSVF (F!!!!!!). There is a large difference
in meaning between RSVF and RSVE.

Most likely the editor has deleted the whitespace in the #d line.
This is important! There must be exactly 128 bytes (including CR/LF)
in the first four lines (#a to #d), since the desktop always leaves
these first 128 byts alone when saving its data, but starts parsing
the file from the beginning. If everest cannot be changed to leave
trailing whitespace alone, either use a real editor :-) or put a
non-whitespace character at the end of the #d line. This line has no
other meaning than being a placeholder, the contents will never be
used.

: NEWDESK.INF file:

: #K 4F 3F 53 44 46 42 43 57 45 58 21 5B 5D 31 #K 4F 3F 53 44 46 42 43 57 45 58 21 5B 5D 31
32 33 34 30 3D 26 49 41 57 52 50 2E 4D 5A 00 00 56 @

It seems to me, to be the same as what happened to me when I upgraded
to TOS 2.06, and started using Newdesk.inf.

This is a bug in the ROM, and a patch for this is available. When the
newdesk file gets past a certain size (I think it's 128K..but not too
sure), then it gets corrupted. The patch fixes this by giving the
buffer some extra memory.

Someone...please help me out here, as I'm not sure if what I'm saying
is right.

However, I have the patch at home, and will bring it in, and install on
HENSA tomorrow. The program is called Shell Buffer. As soon as I upload
to HENSA, I will post.

Hope this helps

695. Re: Vroom and Formula One

Newsgroup: comp.sys.atari.st
Date: 1994-07-14 10:01:29 UTC
From: jperez@uhunix.uhcc.Hawaii.Edu
Message-ID: <CsxD6I.D2t@news.Hawaii.Edu>
Source record: 183735

: Vroom - made by Ubisoft, who generally do a great job. Screen shots look
: good :-).
Vroom and F1 (from Lankhor and Domark, respectively) are superb
Pole Position type games. I have the demo for F1 so I am not too certain
as to all of it's features, although control is outstanding! Vroom and
the Data disk (additional racing circuits and more flexible control
options) are members of my collection. Both of these games are extremely
fast on even 8mhz machines. They have great digitized sounds (and even
doppler effects when cars are passing). There is even multi channel
sound so when you whiz past a pack of cars, it sounds like you might
expect). Vroom also supports Cyber-Linking (computer to computer
communication) although the control suffers here (since you must use
mouse and your traction seems to go all to hell) - with the Vroom data
disk, you can improve this somewhat.
I believe Domark's F1 supports head to head play on the same
split screen (rather than across null-modem). Definitely the among the best
driving games that I have seen for the ST.

: Formula One Grand Prix - made by Microprose, I have seen it refered to as
: the best for the ST.
Microprose grand prix is programmed by Geoff Crammond (who also
wrote Stunt Car/Track Racer). It comes on four disks, is heavily disk
protected, has manual protection as well, and is not hard disk
installable. To get onto the track at all requires much too much disk
swapping and loading of unnecessary stuff. I believe that you can avoid
the first disk altogether since it has intro stuff on it. MGP is also
very slow, even on a 16mhz Mega STE it is not very much fun - especially
if you have other cars on the track. Even cutting out most of the detail
doesn't do the trick. It is an excellent simulation, but just not very
exciting to drive. Also, there is no possibility of driving with the
mouse. I sold mine.

: No Second Prize - motorcycle racing, 3-D solid polygon graphics, have seen
: one good review.
I also have a demo of NSP - it is superb. Extremely fast and
smooth with banking (the horizon banks as you turn, etc. I haven't seen
a better motorcycle game although RVF Honda (From MicroStyle I think) is
supposed to be pretty good too. I can't stress enough how smooth the
polygons move in this game. It's exciting to drive.

: Stunt Track Racer - (Can't go without mentioning this one!)
This is a fabulous game! It supports Cyber-Linking. You race
on three dimensional tracks (one of them is set up like a roller
coaster). The tracks have ramps, jumps, hills, banks, you name it. You
actually spend a fair amount of time airborn in this game. This is

particularly fun when you are racing against a buddy and you come up behind him at a ramp, floor it, soar a while, and then land on top of his car. This does a lot of damage and can really help you win the race. You can also ram the opponents, force them off the track, etc... Do yourself a favor and check this one out. Unfortunatly, STR is HEAVILY protected (at least in the versions that I have seen, and will not function on the Mega STE at all - the protection will probably fry at 16mhz so try before you buy.

*** Reportedly there is a hard disk installable version of Stunt Track/Car Racer out there (which I would very much appreciate getting) since I own the game and can't play it any more sine I have an STE now. Copy protection seems to function mostly to prevent honest users from being able to enjoy their games. Copying games like this is not that tough - getting them to run on a Mega STE is!

Remember - they are reportedly making Domark F1 and Stunt Track Racer for the Jaguar - so perhaps you should wait and see.

697. Re: Why doesn't Flop_fix work for me?

Newsgroup: comp.sys.atari.st
Date: 1994-07-14 10:08:36 UTC
From: s002893@YPSERV.rz.fhtw-berlin.de
Message-ID: <3032r4$1bq@RW320B49.rz.fhtw-berlin.de>
Source record: 183732

flop_fix together with the non-pro ICD-driver (which is one or two years old)
works on a German TOS.

I am sure, that the American TOS has the same errors, but it is possible
(and it seems to be so) that the different language versions of TOS
have some differences in the first $8000 bytes - or, may be, in the RAM-usage.

(Sorry, because these bugs are "deep" in the TOS the patch is not very easy,
that is why there are some dependencies.)

At the moment I see only one way for adapting flop_fix to the other
language versions of TOS20.6/3.06. I need at least one non-German version!
I would be happy, if somebody could read out his TOS and send it as
uu-encoded personal message. (ye-ye copyright ...)

Apparently so, since Time-Warner just merged Atari Games Co.
and Tengen into Time-Warner Interactive a few months ago. I
don't know if the Atari Games and Tengen name are gone now,
though (after the merging, an ad put out look for programmers
said Atari Games, though, so perhaps they do still exist
within TWI, though the most recent Atari Games arcade game
came out under the TWI label!).

From: zap@eskimo.com
Message-ID: <CsxMK3.B5G@eskimo.com>
Source record: 183602

There are many good archivers on the net and I recommend having a collection that includes arc602 or turboarc, a zoo and lharc prg. Zip is becoming popular on the archives also.
To decompress the file, put your arc602 on the same disk as the file. The correct command would be hx filename.arc
If you keep your archiver in a seperate location than the file being accessed then drive specifiers become important. I have myine on drive d on my harddrive and new files on drive a so my command would look like hx a:filename.prg d:\new*.* which decompresses the file from the disk drive and puts the result in a folder called new in my hard drive partition d. Have fun! Hope this helps.

From: raz@MCS.COM
Message-ID: <303hi7$sle@Mercury.mcs.com>
Source record: 183746

Distribution:

Also, there is a program, PS2FORM, which formats floppies in IBM PS/2 format on the ST. It even puts a random ST-type serial# on the disks so you don't have problems with preformatted IBM disks (which can confuse early versions of TOS).

If you are formatting disks on an IBM, or are using preformatted disks, there is an IBM program in a.a.u.e called SERIAL.EXE which puts ST-type serial #'s on IBM disks.

Hope this helps,

Anupam Razdan

I have Vroom and F1. Both are good, but no matter what anyone else might say
F1 is the one to go for. Vroom is good, because it seems simple and easy
to run, but F1 is a exact copy of the real Formula One race world cup. All
tracks are exactly like it is in the real life. And not to mention the control
is almost simular to the real life, (well, taken from a guy who havn't driven
a real F1 car (yet)).

F1 is the best, and there will probably not be any game better than this,
(racing games only though).

706. Caligrapher display problems.

Newsgroup: comp.sys.atari.st
Date: 1994-07-14 14:27:54 UTC
From: t92tj@psi.hh.se
Message-ID: <T92TJ.94Jul14162754@psi.hh.se>
Source record: 183612

I have recently installed Calligrapher on my 1040STFM's HD. I have a hard time make it display any blocks, though the blocks are there, they just don't show on the screen. The same goes for tables. They are there and print ok, but don't show up on screen, just the text no frames. Equally when i load the flextext or formulaedit paks. Nothing on screen as far as the graphical part.

And furthermore if i tries to update the flextext, the program crashes with to bombs on screen. If I then start Caligrapher again it imidiately crashes with four bombs and the computer hangs completely.

Another peculiar bug is that I _have_ to have UIS III installed. Without it I can't load any files after starting Caligrapher. I get the message "Not enough memory" as soon as I click on the "load" entry in the filemenu.

This is with TOS 2.06. However if i start the computer with TOS 1.2 it works like a charm. The problem is that I can't use my HD then.
Running Caligrapher from floppies? Too slow. Too cramped.

Anyone encountered this before? Bug in Caligrapher, TOS 2.06, Memory problems?

Thanks for any advice!

Tryggve

My system looks like this: 1040STFM + 256MB IDE HD with Hard and Softs IDE interface- and TOS 2.06 upgrade card.

There's a distinct lack of top ST games around just now, so I was more
than pleased to download Manic Minefield from umich!
It's great! Sampled sound and music, and a topgame to boot!
And it rt runs on a 520 too!

Why aren't more shareware games like this?
My cash is in the post!

Does anyone know of any more games by the same guy?

Rich.

p.s. it's called manic.zip and it's in the games directory of the umich
archive, anticipating the posts which will follow asking where to get it!

Electronic Arts support any Atari product? Fat chance. Ever since
they openly espoused the Amiga over the ST, they have ignored or
insulted (the ST conversions of Music Construction Set & Marble Madness
spring to mind) Atari users. You'd have a better chance of getting
Lotus to port 1-2-3.

I've played deom's of vroom and NSP and both play well and look good.
However, F1GP gets my vote for variety, realism of handling and competition,
and for elevating my blood adrenaline/epinephrin levels!! Falcon compatible
if you switch off caching and I've also played it on Tos2.06 ST. I love it!!
Ben..

I replied to this earlier, saying, as everyone else has, that you need an archive shell for use with ARC, LZH, ZOO, ARJ, etc. I suggested CFJ's ARCSHELL, since I've used it in the past and thought it was an excellent program for ARC and LZH. However, I just downloaded TWOINONE last night, and I have to say that it is *by far* the best arc shell I've come across. It supports ARC, LZH, ZIP, ZOO, and ARJ, as will as UUencoding/decoding and virus detection. It's interface is much like STZip 2.x from Vincent Pomeny (which, incidentally, I think is easier to work with than TWOINONE). If you aren't already using TWOINONE, I strongly recommend giving it a try.

In the limited time I've tested it, I haven't encountered any bugs at all, though be warned, due to the way Warp9, QuickST, and TurboST handle text, text is written directly to the screen when (un)arcing, rather than to the proper window. According to the docs, this is a problem with the accelerator programs and not with TWOINONE, and NVDI will work just fine with the arc shell. The problem is only annoying; it doesn't affect the opperation of TWOINONE.

I'm going to continue testing it for a week or so, and if it continues to work as well as it has, I'll be sending in the registration fee real soon. :-)

Just my $.02

Tom Hopper
hopper_t@msupa.pa.msu.edu

P.S. TWOINONE is a *shell*, so you'll need the appropiate .TTPs to use it (ARC602.TTP, etc.). -TJH

I have been hearing all these software about connecting to the internet but I haven't heard any thing about hardware. Does the TT or Falcon have a ethernet card build it so you can hook it up to a thick, thin, or 10 base-T cable or are you just talking about UUCP, PPP or SLIP.

Thank-you
Keith Lai

MidiNet fails too often, littlenet is too restrictive, and Mx2Net does not
work well enough, not between the Falcon and the Mega in any case.

one you all forgot:

Combo Racer -- motorcycle racing game by Gremlin Graphics.

I've spent a few dozen white-knuckled sessions with this. It's
no revelation as far as games go, pretty good graphics, so-so sound.

It allows you to race a 'season' on up to eight tracks; you can set the
number of laps to any multiple of 5, and you can create your own
tracks -- which is good, because the standard ones are not too
challenging. (Your cycle is considerably faster than the others
on straightaways)

Downers: not HD installable. No difficulty levels, no tweaking of
the cycle itself. No head to head either.

I'm sure there are better race games out there....but i ain't seen em
yet. You might give this a try.

From: hallvart@ifi.uio.no
Message-ID: <30469g$rbu@hnoss.ifi.uio.no>
Source record: 183611

Hi,
I've been searching through all my clipart files and stuff on the Internet
via "X-Mosaic" etc. but can't find the pictures or "illustrations" I need.
Can someone help me, by either sending UUencoded files or telling me where to
get the following:

- A globe with the USA and Europe shown, or a folded out whole-globe.
(it needs to be clear and simple, preferrably just like in an atlas, but without
all the details. And a big size.
- a clipart of an angel
- a clipart of a big heart (preferrably in a '3D' look, or with 'shiny' corners etc).

The globe is the most important one.
I can take almost any standard picture format: IMG, GIF, JPEG, TIFF, PBM... to use
with either an Atari STE and/or a SUN UNIX system.

I am *NOT* looking for photographic type pictures, but more of the clipart type.

Thanks!

Hallvard, Oslo, Norway (hallvart@ifi.uio.no)

Actually, come to think of it, this problem manifested itself when I
turned the "delete trailing spaces" option ON... hmm, methinks it is
time to turn it off!!!

So... to fix it, I must put a "space" after #d??????? Perhaps I can cut
and paste from an old newdesk.inf (and old new- heh) file... Okay.

Thanks a lot for the help!!

>Lotus to port 1-2-3.
>

By and large, this is true! Many of their older ST conversions were
pathetic - remember ARTIC FOX?

However, once in a while they did release a decent or even excellent ST
title. Deluxe Paint ST comes to mind and it was (is) probably the BEST
general purpose graphics package for Atari STs.

EA generates the majority of its revenues from cartridge based games. As a
result, they will support which ever platform that will make them money.
SEGA and NINTENDO are already proven markets. The Jag must establish itself
in a defined market so EA and other important developers can support the
machine with the titles people want.

Interestingly enough, the Jag community is unlike that of the other systems.
The vast majority of its users are not little kids but adults. This in itself
means that customers will be more discriminating and vendors will have a
harder time porting titles that have done well previously on other systems.

Richard Marsden <ax653@Freenet.HSC.Colorado.EDU> writes:

>Why aren't more shareware games like this?
>My cash is in the post!

Well, I'll tell you why...

Atari users tend to take shareware for granted and don't register for it.
I know I've been guilty of that (but I've changed and started to) and I
know plenty of other people have when I worked on some ST shareware games.

Case in point: Insectroid - it's a decent game for only $10 (plus lots of
extra stuff). It went out on the MArch '93 ST Format cover disk and
and only a handful registered for it.

Don't bother registering for it now though...the author and I have had a falling
out and he won't split any money received.

Still, I'm glad you did register for that game. Hopefully, enough will think
alike and keep the author from leaving the platform like I have.

Ari

Me thinks you have the DMA Bug, does not show at first, on a STE here it had to
be on for 24 hours....

Take off the top and lift out the Disk Drive,the chip is under the disk drive,
its the large 40 pin chip at the edge of the PCB, if the
Part No. is C025913-38 then you have the badchips...

Try and get a replacment IC, if you can...???

Does any one know were I can get some of these later DMA chips, will Atari
USA supply these...???

730. Re: Vroom and Formula One

Newsgroup: comp.sys.atari.st
Date: 1994-07-15 00:20:50 UTC
From: am136@FreeNet.Carleton.CA
Message-ID: <CsyGyq.20q@freenet.carleton.ca>
Source record: 183625

In a previous article, Kim@dksoft.ping.dk (Kim Andersen) says:
+I have Vroom and F1. Both are good, but no matter what anyone else might say
+F1 is the one to go for.

"No matter what anyone else might say"?! Gee, I guess nobody else should bother posting on the topic then.

+Vroom is good, because it seems simple and easy to run, but F1 is a exact
+copy of the real Formula One race world cup. All tracks are exactly like it
+is in the real life. And not to mention the control is almost simular to
+the real life, (well, taken from a guy who havn't driven a real F1 car
+(yet)).

Well, I'd go along with that much. F1 is almost tediously realistic. Vroom, on the other hand, is blisteringly fast and has the null modem head-to-head option. It has a lot less depth than F1 but is much more fun to play.

Stephen

I think your friend is asking too much. I sold mine for $800+ but I had
a new color monitor, an 85meg HD, and mine was less than 6 months old.

732. Complete 1040STE system w/Hard Disk for SALE!!!!!

Newsgroup: comp.sys.atari.st
Date: 1994-07-15 01:04:57 UTC
From: Ari Feldman <ari2550@delphi.com>
Message-ID: <xE1QSUi.ari2550@delphi.com>
Source record: 183622

Well, I hate to do it but I do need the cash, so...

* 1040STE computer w/TOS 1.62, 4096 colors, stereo PCM sound, & Blitter chip
* Rimik Beatle mouse (hi-res tracking)
* Epyx 500J joystick
* Maganox 1CM-435 stereo color monitor w/tile swivel stand
* Supra 45meg Hard Drive w/DMA pass through
* CopyIIST v2.5 (last version) w/manual
* Deluxe Paint ST w/manual
* Marcel 2.2 Word Processor (registered version) w/manual
* Word Writer 2.0 w/Manual
* SunDog Frozen Legacy w/Manual
* Dungeon master w/manual
* Gunship w/manual
* MAGE Arcade 10 Pak (never released commercial games)
* Supra HD Utilities
* Flash 1.52 w/Manual
* Assorted PD & Shareware games and utilities
* 3 Plastic 40 disk capacity disk holders
* Abacus ST Disk Drives: Inside & Out
* Abacus ST Internals
* GP-Edit Library (support library for GFA Basic 3.5)
* GFA-BASIC 3.5 upgrade

All hardware is in good condition. Most software is missing boxes but is
original and includes documentation.

Asking: $450 for the whole package - including domestic shipping (US 48 states)

I will not parcel out the system, so don't ask!

Please send all *reasonable offers* to my e-mail address.

Regards,

Ari

733. Re: Electronic Arts making games for Jaguar?

Newsgroup: comp.sys.atari.st
Date: 1994-07-15 02:07:47 UTC
From: aa399@cleveland.Freenet.Edu

In a previous article, clund@wpo.uwsuper.edu (Carl Lund) says:

>Electronic Arts support any Atari product? Fat chance. Ever since
>they openly espoused the Amiga over the ST, they have ignored or
>insulted (the ST conversions of Music Construction Set & Marble Madness
>spring to mind) Atari users. You'd have a better chance of getting
>Lotus to port 1-2-3.
>

That's because you had all of those Amiga users writing letters to Electronic Arts in every part of the world. If there is one thing that I admire about the Amiga Community, it is the fact that when they want something, they make sure that they get it.

Besides, the Amiga was a bit more funner to make games for. In fact, it was originally made to be an expensive game machine! Can you imagine if it was released as a "interactive multimedia system" for $300 or $400 without disk drive, keyboard, etc.? It might have been the "standard" that 3DO is attempting to be today.

I have heard from a lot of Jaguar programmers that they feel the Jaguar is fun to program as well. If they feel it is fun to program, they will do what they can to make their games good.

>
>Yeah... like it seems to revert to its previously goofy state after I
>run another program!

I had the same problem; even after I fixed the configuration of my NEWDESK file, it would still screw things up after running programs. I fixed it by editing it in a decent ASCII editor (ALICE, to be precise) which would show carriage returns. Basically you need 128 bytes (characters), including carriage returns, in the first four lines (#a through #d). This is accomplished by adding spaces in line #d. Remember to count *all* characters in that 128 (each carriage return counts 1, by the way). Andreas Schwab posted this fix a couple dozen messages back, so all thanks goes to him.

Thanks Andreas!

] >] Thanks in advance for your help.
] >
] >It's obviously the UK version.
]
] Nope. All the Populous II versions are like this. That's why they include
] the CHANGEHZ.PRG utility on the disk, although the confusion is warranted
] as their was no reference to it in the docs in my package.
```

Righto... :) There was obviously no Hertz changer with the PAL versions, so it seemed logical there would be a different version!

I find it hard to believe that a game that doesn't seem to _use_ the extra resolution of PAL (and why should it on an ST!?) should run perfectly well on an NTSC system... Some pretty wierd timers must be used! :)

739. Re: MegaSTE 16mHz booting

Newsgroup: comp.sys.atari.st
Date: 1994-07-15 05:04:09 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <3055c9$fa6@golem.wcc.govt.nz>
Source record: 183635

] It occurs to me that the perfect solution would be an executable boot
] sector that switches the machine into 16mHz, then waits for a keypress.
] The user would switch disks at that point, and when the key is pressed
] the boot continues. Even better would be to have the program check for
] another executable boot sector, run it if it exists, else continue the
] normal boot (which will go to the auto folder, etc.). This would provide
] MegaSTE users with one disk that can boot any floppy in 16mHz mode.

There was a program somewhere that had this as one of its features, but
I can't recall what it was....

The auto-booting ones can obviously be loaded as you specified

(] There are a few programs that allow you to do this with games that have an
] executable boot sector. The one I use is called booter, and I have a disk
] with this program in its auto folder that I use to boot games that fit the
] bill (it runs, asks you to switch disks, and you press a key). This
] program is on atari.archive.umich.edu in /Ste/Mega, BTW.
)

but the ones loading from the AUTO folder are somewhat trickier, especially
if the disks are constructed in such a way as they don't have enough
room for the booter....

Possible a good idea would be to put a virus immuniser onto the disk and
then use "booter" in the usual way (some immunisers are executable, either
UVK or Antidote does this... One does, the other doesn't....)

And of course, you could always try one of the DC-Format booters, (perhaps
a "bypass hard-drive" bootsector which stops the wait-delay of TOS >1.4
machines when you turn them on....

Other than that, making a backup of the disks & trying the auto-booter
routine as above would appear to be about the only way other than making
a bootsector as you wanted! :)

740. Re: Vroom and Formula One

Newsgroup: comp.sys.atari.st
Date: 1994-07-15 05:12:14 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <3055re$fa6@golem.wcc.govt.nz>
Source record: 183636

] I have developed an interest in racing games as of late. I have heard of
] three cool ones, and wanted to solicit opinions from other gamers.
]
] Vroom - made by Ubisoft, who generally do a great job. Screen shots look
] good :-).

Good multi-player options. A game, not a simulator! :) Graphics are
nice & clear, stopping in the pits is nigh on impossible :) Good
crashes (the car blows apart, crumples etc.) VERY smooth!

] Formula One Grand Prix - made by Microprose, I have seen it refered to as
] the best for the ST.

Made to be far-too realistic. Very involved. Extremely user-configurable,
lots of different tracks, quite bad sound. Good graphics as far as
3D-filled-polygons go. Again, plenty of good multiplayer options.
(I didn't like this myself, it doesn't feel "right", but then again, I've
yet to drive in similar conditions in a car.... :)

] No Second Prize - motorcycle racing, 3-D solid polygon graphics, have seen
] one good review.

Wow! This _really_ impressed me! The demo on the ST format disk just
wasn't enough! amazingly smooth & fast 3D graphics, reasonable sound,
and it all played reasonably realistically. It didn't have the same
detail as F1-Grand Prix, (which has things like skid-marks produced
after cornering too hard etc.), but it held my attention longer than any
other racing game! It's mouse-controlled, which produces VERY responsive
gaming! The computer opponents are actually quite _good_ for a change,
and you can choose from 6 (or 7, I forget which), drivers all of which
have various different abilities etc....

Vroom: Fast & Fun...
F1-GP: Realistic & very involved
No 2nd Prize: Fast, smooth & reasonably realistic as far as control goes...

I've got an English version of ST-Guide. If you would like it, then
you may grab it from my ftp machine:

rea017000001.lancs.ac.uk

username: anonymous
password: your e-mail address

This is a version pulled from Genie.

Joe Connor is doing UK support for ST-Guide, and the full package will
be appearing on HENSA soon, as hensa is the official site in the UK,
apart from cix, to hold Joe's supported software.

In the meantime, you may grab the file:

stguide.acc

from my machine mentioned above.

Hope this helps.

There seems to be a slight problem with my ftp machine. I got this
message from someone who tried to connect:

> I tried to get st-guide.acc but it didn't seem to work.
> I waited for about 1 min. and nothing happened, so I disconnected.

There seems to be a problem with using ls twice.

Once you log in, do an ls, followed by hash and bin, to set binary
transfers.

Then from your first listing, get the files, one by one. I'm sorry for
this
inconvenience.

I will try and fix this soon.

OK, very briefly....

PGP is an encryption/decryption package. It allows you to encrypt and
decrypt messages/files to/from someone.

This way you can keep your messages and files secret, and away from
prying eyes. Only you can read the messages sent by the sender, and
only the recipient can read the messages sent by you.

I hope this is enough for a very short explanation of pgp. It should
give an idea of what pgp is. BTW, UK users of PGP Shell, can register
with me now. v0.9 is also available from micros.hensa.ac.uk

*** FARLEY'S ***

Well I found a very nice candy here in a store last Xmas,
it was Butter Toffee made by Farley's very nice, I ended up
buying four boxes, and its made in the USA....

There were a lot of USA Made candy in this Supermarket at the 1993 Xmas...

As long as we're on the topic of candy, I suggest people look for Gayle's Chocolates. They're made in the US, possibly only in Michigan, but their chocolate truffles are by far the best chocolate I've ever tasted (and I make it a point to eat any new chocolate I come across :-). I've tried Cadbury's, and compared to Gayles, Cadbury's is stale and plastic.

Of course, maybe I haven't had any of Cadbury's "good stuff," but I'm not the only one who thinks Gayle's is supreme... :-)

At a dollar per truffle, one would expect good chocolate. YUM!

AFAIK it should work OK as long as your in a 2 color mode on the Falcon.

>Keith Lai
>lai@paf.gsfc.nasa.gov

Most of the software is PPP, UUCP or SLIP. But there is TUW-TCP which
handles ethernet cards. What you need to do is build an adaptor and purchase a
card then recompile the source to work with your card. There was also at one
time a VME based Ethernet card that came from Atari Germany. I don't know if
that is available at all anymore.

Source record: 183661

Well with the Tom Haines, there is now a new version of "Don't Click Jim's Head". It should now work with machines with less than 14megs (oops), but I had some problems with MTOS. Anyway Tom has made some great additions with the inclusion of a .mod file player for the Falcon as well as an imbedded .mod file.

Source and executable are in the same file. DONTCLI2.ZIP which should be available later today on a.a.u.e.

There is another possibility: An Ethernet port on the SCSI bus! These
devices are (were?) quite popular on Mac Powerbooks.

The problem with all the solutions is the software, which either
doesn't exist, or is an absolute sod to compile and set up.

>Atari users tend to take shareware for granted and don't register for it.
>I know I've been guilty of that (but I've changed and started to) and I
>know plenty of other people have when I worked on some ST shareware games.

People have to come to the understanding that not paying for shareware
that they keep and regularly use is just another form of software piracy.
To be fair, I really doubt if Atarians are any worse, percentage wise,
about not paying for shareware that they regularly use. Very few folks
actually register (pay for) their shareware on any platform.

But the installed user base of Atari computers is soooo small compared
to other platforms, it amplifies the problem. The PC base (and the Mac,
to an extent) is so HUGE compared to Atari, that shareware authors can
get by on an even smaller percentage of paying users. True, there is a
lot more software competing for those sparce shareware dollars, but the
potential for making money in PC or Mac shareware exists; I would not
make the same claim for the Atari market.

To paraphrase a popular colloquialism...

"It's the MARKET, stupid!" :)

Cheers,

Mickey Boyd (boyd@gauss.math.fsu.edu) wrote:

: Sure. Might I suggest that you prepare a demo version of your program, with
: the fast scrolling you describe? The newest batch of modem programs
: concentrate more on compatability than speed, which is good for folks who
: own faster machines. However, the best choice for UNIX modeming (IMHO) for
: 8mHz machine owners is still Uniterm, due to its speed. I think that a
: super-fast scrolling telecomm program that supports Zmodem directly (which
: Uniterm does not) and perfect vt100 would be popular. You might disable some
: other features to encourage registration, but the fast scrolling is what
: would probably sell the program (and should therefore be included in the demo,
: again IMHO). Just my $0.02.

I'd consider making a demo, except for two things: ANSITerm 1.90 demonstrates most of the capabilities of 1.91 except there is not fast scrolling or auto-login macros and a few other things, and secondly, I can't get the Laser C shell to run on my Falcon. Any rewrite to the program would be a COMPLETE rewrite (I have been working on a few things of this sort).

ANSITerm doesn't support Zmodem internally, but on an ST, XYZ works with it quite well (well, even on my Falcon too). ANSITerm does perfect vt100 emulation... I use it with UNIX all the time, and it's nice to have no problems... it even does underlining. It's also super fast.

I'll prepare a text to upload for those who want to know about ANSITerm 1.91.

Source record: 183675
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I had a problem with some accessories conflicting with System Audio Manager and, with the help of XBoot, was going throught the process of elimination to figure which was the culprit. In the process, I also concluded that there might be correlation with the order in which they are installed in the system. Using a directory sorter, I alter the order in which they were arranged on drive C: but found that it didn't have the expected effect in the order in which they appear under the DESK drop-down menu. Anyone know if there's any rhyme or reason to the way they appear? In TOS 1.4, the first ACC loaded was at the bottom of the list, the next was second from bottom, etc. In TOS 4.04, they are not in order at all.

Here's how they stack up for me:

On disk in this order:	In drop-down in this order:
WARP9 control panel	EdHak
STalker SAM Config	
MultiDesk Deluxe	MultiDesk
XControl WARP9 c.p.	
SAM Config XControl	
EdHak STalker	

Anybody have any clue why this is?

Right on target! ICD has always dealt straight and honest with me, and I have not only bought software direct but handled two upgrades directly with its people -- and the only complaint I can make is that the Atari tech support is not "open" every day of the week to answer phone calls. When he was there, the advice and counsel was first-rate ... and he called back within 24 hours every time. That's more than I can say about some of the folks I have dealt with in the MS/DOS arena. ICD is A-OK!

782. ST-Guide, available at HENSA

Newsgroup: comp.sys.atari.st
Date: 1994-07-15 18:29:26 UTC
From: vctec@westminster.ac.uk
Message-ID: <Cszv7u.lxy@westminster.ac.uk>
Source record: 183680

Hi all

ST-Guide is now available at micros.hensa.ac.uk

under

micros/atari/tos/o/o001/
filename: st-gui06.lzh

st-guide tools, are under
micros/atari/tos/o/o002/
filename: stg-ut06.lzh

Documentation is still in German, but there is an Ebglish accessory in
the package. Joe Connor is supporting the program in the UK, and so
expect to see an English version with English docs, within the next
couple of weeks at HENSA.

The ST-Guide files may also be downloaded from my personal experimental
ftp machine: rea017000001.lancs.ac.uk

login: anonymous
pass: your e-mail address

there is a slight bug with the ftp server on rea017.....

you can only use ls once, to list the files....

so what you do is.....login, list the files with 'ls' and not 'ls -l',
then

hash
bin
get <filename>
get <filename>
...
...
quit

This should work.

If not, mail me, and I'll see what I can do. But you should be able to
get it from hensa, anyway.

Danny

>It'd be good if people would actually say what everything is used for, rather
>than assuming everyone knows.... (I know more or less what PGP etc. is,
>but no doubt many don't!)

Sorry, but since I have released several previous versions I assumed
that anyone who was interested would know what it was about. You know
what happens when we ASSuME sometimes. :)

Anyway, PGP Shell is a program that provides a nice GEM Shell (ie a
graphical user interface) to the Pretty Good Privacy program (PGP.TTP)
by Phillip Zimmerman. As you know, a TTP requires a command line with
the correct parameters. PGP Shell allows you to manipulate those
parameters 'graphically' so you don't have to memorize all the commands
and parameters.

And in case you didn't know, PGP is a program that allows you to encrypt
e-mail so that it can only be read by the person(s) you are sending
it to. This allows for truely private e-mail regardless of what electronic
network you send your mail over.

Feel free to ask if you have further questions.

RandyH

Well, you could grab xearth, compile and install it, run it (it will produce
a huge spinning earth on your root window), dump it using xwd et al, then
use xv to convert it to whatever format you like (and to make it monochrome,
which should not be too much problem). This is a roundabout way of doing
it, for sure. Actually, xearth might come with a bunch of bitmaps that
you can use directly. Good luck.

785. For Sale: SupraDrive case

Newsgroup: comp.sys.atari.st
Date: 1994-07-15 19:12:16 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <306n2g$1fq@mailer.fsu.edu>
Source record: 183678
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have the case from a SupraDrive 80mb for sale. It includes a shoebox style case (marked "SupraDrive Atari Hard Disk" on the front), power supply, fan, Supra host adaptor, and all cables and such. It is exactly as it was from the factory, except there is no hard drive contained within (it takes one standard 3.5" SCSI device). The mounting hardware for the drive is included (it had a Quantum 80S in it before). The case is grey enameled metal, with a green power and red activity LED on the front. I do not have a copy of the Supra host adaptor software, but I could probably dig one up if needed. I believe the ICD Pro utilities will work with this card, which would be a much better choice IMHO.

Toad computers sells a very similar case for $99 (without host adaptor!), which I think is a bit high. I'm asking $50. It is in like-new condition. Alternately, I would be very interested in some trading, as opposed to cash. I am in search of an external DSDD floppy drive (must format out to at least 83 tracks, which can be checked with DC MaxTracks on atari.archive.umich.edu), a MC68881 math coprocessor, Wico bat handle or Ergo joysticks, and numerous software thingies (particularly games).

Please email all replies.

786. Atari ST emulator for Mac??

Newsgroup: comp.sys.atari.st
Date: 1994-07-15 19:40:57 UTC
From: dtarico@OCF.Berkeley.EDU
Message-ID: <306oo9$gcs@agate.berkeley.edu>
Source record: 183679
Cross-posted to: comp.sys.mac.hardware,comp.sys.mac.misc,comp.sys.mac.apps,comp.sys.atari.st

Is there any type of Atari ST emulator available for the Mac (hardware and/or software based)? If Gemulator could be done for the PC, then it certainly seems feasible (even easier) for the Mac.
Thanks in advance for any info related to this topic. Please note that this message is cross-posted, so please make your followups appropriate. Thanks!

Doug Tarico

: MegaSTE users with one disk that can boot any floppy in 16mHz mode.

I would like to pester Trace Technologies (from DC Software) into
re-writing DC-Bootit to handle non-boot disks and CPU speed switching.
It would seem to be a minor re-write and would meet all of my booting
needs (except TOS compatability). Now if we could encourage Darek
Mihocka (QuickTOS) to collaborate so that DC-Bootit would also allow
reading in an older TOS version before booting - that would be the
ultimate booter.

I'm not sure if there is one specifically for the 4p - I believe that the
4m driver will work (or it has for me anyway). Now I have a 4m so I
can't do any more testing. The driver should have come with the latest
2.2b upgrade/patch but if you can't find it, I'll try to send it to you.

Ok. Thanks for the info. I worked as a video game tech until about 1 month ago, and I hadn't heard anything about this. Considering the fact that it was my business to know such things, it kind of surprised me that I hadn't heard about it.

Later,

791. Help needed: GEMview

Newsgroup: comp.sys.atari.st
Date: 1994-07-15 23:42:43 UTC
From: hallvart@ifi.uio.no
Message-ID: <3076tj$959@dyggve.ifi.uio.no>
Source record: 183685

Which files do I need?
- - - - - - - - - - -

I'm pretty confused now. I downloaded GEMVIEW some time ago but didn't
get it to save in different formats than (X)IMG, so instead of fiddling
more around with it, I downloaded the files again and started de-compressing
the files. But... which files do I need, and what do they do? Seems like GEMVIEW is
a LARGE program with lots of files. I'm just wondering if I need them all, or if any of the
files are duplicates (er... updates of older versions), or if they're some other things..
I downloaded the from a.a.u.e. (all of the gemview files), and have the following:

GVW_INST.APP (decompression/installation program)
GVW_V303.PAX (Version 3.03 of GEMVIEW??)
GVW_TOL0.PAX (older version of GEMVIEW or utility disk????)
GVW_PIC0.PAX (demo pictures of various formats only?- not needed??)
GVW_NM06.TOS (New save and load modules? addition to the Gemview package?)
NEW_GEMV.ZIP (??? a newer version of Gemview, or additions of files?)

Thanks.

Hallvard, Oslo, Norway

>
>Stephen
>

I'll not say i disagree, cause i dont. But F1 is beeing played right now via network. Well, what we do is to set up an tournement and then after one has driven, then we make a backup of the save game, and send it to the next in the row, (pretty funny). F1 on the Falcon is very fast, and runs smoothly. I have yet to try Vroom on my Falcon, but as you said, it's fast as well.

>That's because you had all of those Amiga users writing letters to Electronic
>Arts in every part of the world.

Nah. Carl is right; when the Amiga was merely an announcement from Commodore, Electronic Arts was already there, backing the machine with everything they had. There WERE no "Amiga users" then to write letters.

Electronic Arts started as a small shop that produced really cool software (ARCHON, PINBALL CONSTRUCTION SET, etc.) and supported everyone equally. Then they degenerated into a chop-shop for quick hacks (RACING DESTRUCTION SET, MAIL ORDER MONSTERS, etc.). Then they degenerated further into an Amiga-cheerleading crowd, while maintaining a false facade of multi-platform support.

Now it's a conglomerate-building monster that swallows up other software houses (Origin, anyone?) in an attempt to be the Microsoft of the video gaming field. And with Trip Hawkins backing the 3DO with his reputation, I expect to see Lotus 1-2-3 *and* FrameMaker on the Jaguar before I see EA put a title there. I'd like to be pleasantly surprised, but I'm not holding my breath.

Racing Destruction Set was a quick hack? Come on, that was one
of the greatest C64 (or 8-bit computer, for that matter) games of all time.
A TON of options and everlasting playability. Of course, I really don't
think that EA is as great quality-wise as they once were.

While it is true that EA had a lot of stuff out for the Amiga when it was
first released, EA also had a lot of stuff for the ST when it came out.
There were a FEW more titles for Amiga than ST, but that is only because the
ST was heading towards the professional market and Amiga was heading toward
the gaming market.

There was also a time when EA didn't want to make some games for the ST
and Amiga. They forgot about the ST, but then decided to go ahead and make
the software for the Amiga. I remember at that time that Amiga users
were writing letters to EA to get some of these games. ST users were not.
That might be because ST users seemed to be jumping ship faster than
Amiga users.

>

The Amiga was getting very popular in Europe around 1990 while the ST was
decreasing in popularity. Also, PCs were selling in the millions.
EA had to make some tough decisions and unfortunately, they decided to start
concentrating on PC games and some Amiga games--leaving out the ST.
This is also when I noticed the company starting to get serious about
home video game systems.

Electronic Arts still makes some very good games. They make the best sporting
games anywhere.

I don't know if we will get EA to make games for the Jaguar? Did you write
Rob? If not, we probably won't.

Ok Folks, here it is again...

* 1 meg, 1040STe computer
* Rimik Beatle mouse (hi res tracking)
* Manavox 1CM-435 Stereo color monitor w/tilt swivel stand
* Supra 45meg Hard disk drive w/utilties and DMA pass-thru

Included software:

* Dungeon Master
* Time Bandits
* Sundog
* Gunship
* Flash 1.52
* CopyIIST 2.5
* Word Writer 2.0
* Marcel 2.2 WP w/manual
* Deluxe Paint ST
* MAGE 10 game pak (unreleased commercial games - Donky Kong, Frogger,
space invaders, Tetris, etc.)
* Nertz - multi-player solitare
* Numerous PD and Shareware software goodies (100's of programs on the HD)
* Abacus ST Disk Drives: Inside & Out
* Abacus ST Internals
* GP-Edit Library (GFA BASIC game programming support library)
* GFA BASIC 3.5 upgrade
* HiSoft Power Basic (Quick Basic compat.)
* 3 40 disk capacity disk boxes

All of the above plus a few bonus goodies for $450 US. Remember, this price
INCLUDES shipping for the continental 48 states), thus the rpice is really
only like $400...

I won't parcel out this system!

However, I will consider all *reasonable* offers on the above system.

E-mail me at:

Ari2550@Delphi.com

Source record: 183553

Help!!!

I've been given a Hewlett Packard Laserjet laser printer (older model), which seems to use the serial (modem) port for communications.

So far I've disconnected the serial lead from the modem and have connected it to the laser, and set XControl's printer CPX to use the modem port. This is on a Falcon 030.

The Laser's self test works just fine, but if I try to send any data (from the desktop) to the printer nothing happens.

I've been thinking that maybe a different serial port lead is needed, although Tandy in Stockport say it should work just fine.

Or then again as Mark Baines advises the HP does not use Epson printer codes, does a special printer driver need to be installed?

Basically I'm completely stuck and can't get the two to work at all, any suggestions would be greatly appreciated.

Before anyone ask's I've not got a manual for the printer which is not helping matters.

My hazy memory says it was more than "a few". And didn't the first Amigas
come with Electronic Arts sample disks? I do distinctively remember an
article on the Amiga in CREATIVE COMPUTING, and it included an entire half-
page sidebar on EA software for it, even before the machine's release.

Yeah, but I think EA started to slide even before the 68000-based machines
arrived. They were producing schlock for the Commodore 64 and 8-bit Ataris,
even.

I know. I exaggerated, but only a little. Still, EA is now no better or
no worse than any other software house, whereas before they used to care
about producing a polished product. Kinda depressing, actually. Then
again, I'm in no rush to see NORMY'S BEACH BLANKET BABE-O-RAMA ported to any
other machine...

I've got a question i've got a falcon 4mb with updated tos 4.04 and NO internal hd and a external 400 Western digital HD but this harddisk refuses to boot with the atari and icd, so do you know this problem i've seen a patch from scsitools but this was only for ide drives they said that atari does'nt call the params as the pc does and they made a bootsector program that does that. I would be very happy with that because every time i'm booting from disk and that takes about 3 minutes and most programs than think that my bootdisk is A and not C.
Thanks very much .
Arnoud Kinderman

Does this offer hold to UK users, too?

Do any of the UK atari dealers run this offer?

815. STORM and 14.4k Modems

Newsgroup: comp.sys.atari.st
Date: 1994-07-16 22:43:36 UTC
From: ejacobso@cln.etc.bc.ca
Message-ID: <1994Jul16.224336.24173@news.etc.bc.ca>
Source record: 183556

I am using a 2400 bps modem with STORM, what I was wondering was can you use 14.4k modems with STORM? Under the baud rate setting you can set it at either 9600 or 19600, but not 14400. Anybody know anything about this?

Loren Kirkby

There is game for SNES called Bomber Man (The arcade version is called
Atomic Punk 2) where you have to blow up little creatures with bombs.
Is there a game for the ST like this?

Loren,
This is a favorite subject of many online computer users so
you'll get alot of responses. The confusion is in terminology.

Connection Rate: is the rate at which your modem and the remote modem
connect, such as 9600 bps or 14,000 bps. This rate is determined by the
modems when they connect. Synonyms: Line Speed, Modem-to-Modem Speed, DCE
Speed.

Computer Rate: is the rate at which your modem and computer communicate.
You change this rate in software. With your modem, this rate should
usually be higher than the connection rate. Synonyms: Serial Port Speed,
Modem-to-Computer Speed, DTE Speed.

(Above taken from Supra Reference Manual p13)

The answer to your question is set the rate to 19200 and it will do 14400
just fine. I leave it at 19200 all the time using Storm.

> its the large 40 pin chip at the edge of the PCB, if the
> Part No. is C025913-38 then you have the badchips...

Ummm, no. Methinks not. If the drive has been ok for a couple of years and has suddenly started doing funnies and losing sectors, it's most likely that you've got a failing drive. You should do a proper format and lock out the bad sectors through SCSI (not FAT, which is as much use as a chocolate teapot, if you have duff sectors popping up in the FAT area.

Problem being is that the Ge-Soft host and s/w doesn't allow much in the way of proper SCSI commands. You'd be better off with the ICD Pro utils, although I had a Ge-Soft card and dumped it in the end as it just didn't make the grade (couldn't handle multiple external SCSI cards (Omti 3527) properly).

Incedentally, there's a lot of piff-paff about these DMA chips. I had a friend with an STE that refused to work (even after Atari UK did the supposed fix). No amount of messing would make it talk to the drives properly. Atari UK were moaned at heavily and they sent another "new" DMA chip - this didn't work either, they sent another even newer number (which was a special for difficult machines, so they said - but it did have a totally differnet number) - this although better, failed to work.

In the end, I pulled the DMA from my Mega (the standard CO25913-38) and it worked perfectly. We told Atari UK and they said "no way, that can't work" but it did. They (under duress) sent a new CO25913-38 and the machines still working to this day (after 2 years without hiccup).

The bulk of the problem with the Ste was the addition of LS245 bus buffers which screwed both the timing and drive levels up. I didn't try fitting either 74F245's or 74AC245's - this I suspect may have solved the problems.

Anyway, the moral of this story is, don't believe everything that Atari etc tell you - I have had more than a dozen machines to sort that have had DMA problems and have fitted/changed DMA's in all of them. The best results are obtained in the end with "old" DMA chips, very short DMA

leads - like 6" and ICD HA's and s/w.

Cheers, Martin.

820. Re: Help needed: GEMview

Newsgroup: comp.sys.atari.st
Date: 1994-07-17 04:18:15 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <30abe7$c3t@golem.wcc.govt.nz>
Source record: 183561

] GVW_INST.APP (decompression/installation program)
] GVW_V303.PAX (Version 3.03 of GEMVIEW??)
] GVW_TOL0.PAX (older version of GEMVIEW or utility disk????)
] GVW_PIC0.PAX (demo pictures of various formats only?- not needed??)
] GVW_NM06.TOS (New save and load modules? addition to the Gemview package?)
] NEW_GEMV.ZIP (??? a newer version of Gemview, or additions of files?)

Hmmm....

] GVW_INST.APP (decompression/installation program)

You need this to install everything obviously...

] GVW_V303.PAX (Version 3.03 of GEMVIEW??)

This contains the main executable, & modules...

] GVW_TOL0.PAX (older version of GEMVIEW or utility disk????)

Various not-all-that-useful graphics tools.

] GVW_PIC0.PAX (demo pictures of various formats only?- not needed??)

Yep, just pictures. Completely un-needed!

] GVW_NM06.TOS (New save and load modules? addition to the Gemview package?)
] NEW_GEMV.ZIP (??? a newer version of Gemview, or additions of files?)

Virtually the same files. One is newer than the other - check the file
date! (I think the ZIP one is the newer one!)

All that you _should_ need, is

GVW_INST.APP and GVW_V3??.PAX

Extract it into any directory (root/graphics folder etc.). Then run
it and make sure that the "Install Path" is set to wherever the
GEMVIEW.APP file is. (Which should have the GVW_SAVE, GVW_LOAD etc.
folders in it).

I've yet to make it successfully extract all of the Doc file, but most
ofit is so obvious, I didn't bother in the end!

It's funny you should bring this up as it does the exact same thing
on my system. For some reason, STalker and Xcontrol seem to want
specific desk accessory slots (though not on the disk that way, they
show up with Xcontrol on the second to last slot and STalker on the
last slot on my system too).

826. 24 Bombs !?! on my STe

Newsgroup: comp.sys.atari.st
Date: 1994-07-17 14:18:32 UTC
From: quest@iac.net
Message-ID: <30bejo$ert@great-miami.iac.net>
Source record: 183570

Hey all! Had a tech. question to ask everyone.. I have a 4 (now 2)
meg STe that for some reason keeps giving me 24 bombs for 'no apparent'
reason. It will bomb when ever it wants, not durring certain programs.
Some days it is worse than others.. Here is what happened.. I was
running my BBS on it and about 1 a day it would crash and give me the 24
bombs. I figured it was the memory handling of the bbs (Ratsoft). But
then it started happening with other software. It eventually got so bad
that I couldn't even boot it.. I shelfed the computer and had my other
STe's serial chips replaced (lightning). Before I shelfed it, I swaped
the memory with my other STe, swapped TOS eproms, swapped about all I
could and it made no difference. (Swapping the TOS chips made it worse.
It wouldn't even come up) I had been using the broken STe for swap parts
and the other day I got it out and put it back togther and it worked.. I
left it on over night and when I awoke it had the 24 bomb problem again.
Now somedays it works great and other not so great.

Any idea what this is? is it the CPU having problems with an address
or something? Any help or comment would be appriciated!! Thanx a lot!

>Syqeust on the Falcon.

Nice try :-)

Syquest 5xxx and 3xxx drives are perfectly happy with stock AHDI drivers 6.04 and up (better use 6.06!). Advanced users might want to configure AHDI to reserve drive letters and set its max. sector size (if there's no media in the Syquest drive at boot time). There are PD programs for that, e.g. Atari's HD_PATCH.PRG.

bye, Peter

One of the Codeheads discussed this on the topic of using CodeKeys on GEnie. The user wanted to know what order the desk acc's would be displayed in the DESK menu. I am not really a programmer but as I remember it he said the order could NOT be predicted. The acc's would load in order as they were on the disk (no sort) but they would appear in the menu according to which one executed some command (forgotten, sorry) first. This initialization command could be anywhere in the program and acc's that have it near the beginning would show up more towards the top of the menu.

The Codehead was of course more eloquent and technically accurate but that was the gist of his post. If I find it I'll repost.

I welcome any and all rebuttals, please.

Sort of, there's and EXCELLENT multiplayer STe and FALCON only clone
called DYNABLASTER.

It will run only on STes and Falcons because it uses DMA Digital sounf fx and
hardware scrolling for some feature (the Blitter too).

It can be found via most decent ATARI FTP sites.

ATARI Happening in Elmshorn/North Germany
-----------------------------------------

Announcement Update 07/17/1994
------------------------------

Computer Club Elmshorn e.V.
ATARI ST/TT/FALCON group
Postfach 261
D-25302 Elmshorn
Germany
Tel. 04121/83298
FAX 04121/82016

This is the third english announcement for the 5th Elmshorner
Computertage from the Computer Club Elmshorn e.V. On 29th and 30th
october is a big systemindependent computer exhibition in Elmshorn.
Elmshorn is a city 30 km north of Hamburg. The ECT has 10000 visitors
on average.

The exhibition are organized by the CCE e.V. and the city of Elmshorn.
The CCE e.V. is one of the biggest german systemindependent computer
clubs.

More than 50% of the exhibitors are ATARI dealers, ATARI clubs, ATARI
software producers and ATARI freaks. It's no PC show, it's an ATARI
happening.

Venue is the KGSE Elmshorn (Kooperative Gesamtschule Elmshorn), the
street called 'Hainholzer Damm'. You can easy reach Elmshorn by train
or motorway. We will put landmaps as IMG images next time in the
BBS.

Exhibition opening:
Saturday 29th october 2 - 6pm
Sunday 30th october 10am - 5pm
- no admission fee

- additional : - big cafeteria
- tombola (we hope, that we get a FALCON computer
for the tombola, please read our next
updates)
- separate product presentations

ATARI exhibitors on the happening Update: 17th july 94
------------------------------------------------------
```

- CrazyBits, Berlin (PixArt,thermo sublimation color printer,
FALCON's, ATARI hard-/software etc.)

- Betz Computer, ATARI dealer (Medusa T40, GE-SOFT Eagle TT, FALCON-
Tower, ATARI hardware etc.)

- Layout Service Kiel, ATARI dealer (ATARI hard-/software, FFT,
GAL-ED, FALCON, Jaguar etc.)

- Hinsch & Partner, ATARI dealer (ATARI game dealer, Jaguar,
FALCON etc.)

- Computer & Service Kiel, ATARI dealer (ATARI hard-/software,
(DTP, FALCON's, TT's etc.)

- VHF Computer, Schoenaich (Janus ATARI board for PC, Platon PCB
etc.)

- Pagedown, Goettingen, ATARI dealer (Script 3.5, Purix Formula
etc.)

- Jochen Merz Software, Duisburg, (Networks SMS2 realtime operating
system)

- Columbus Soft, Darmstadt (Ergo Pro GFA BASIC developing system)

- Hahn's DTP, Elmshorn (Calamus SL DTP)

- Softwarehaus Alexander Heinrich, Kaiserslautern (Maxidat, Videotext)

- we are negotiated with many other ATARI and
software dealer, please read next updates

- Computer Club Elmshorn e.V./ATARI ST/TT/FALCON group
(FALCON's, TT's, ST's with ATARI applications, demos,
Cubase MIDI, ATARI programmers etc.)

- Computer Club86, 74004 Heilbronn

- we hope, that foreign ATARI clubs are in Elmshorn, too !

Additional, we plan a big meeting of ATARI mailbox users with a
restaurant visit on saturday evening etc. Please, contact Ole
Marienhagen for this meeting ideas.

```
* ********************************************************************
* This is the first update of our exhibitor list and the result of *
* the first advertising week for our 5th ECT. I've invited more than *
* 100 hundred ATARI dealers and software producers. *
* We will update this list every week ! *
**********************************************************************
```

This is a message is for all european ATARI enthusiasts, especially for
our dutch, scandinavian, polish and british ATARI friends. Let's have a
big ATARI party and two nice days.

Jens Schulz
Manager of the ATARI ST/TT/FALCON group CCE e.V.

Foreign ATARI computer clubs or ATARI exhibitors are invited for this great ATARI Happening, too.

- no cost for exhibitors (all free)
- CCE e.V. support exhibitors with tables/amperage
- advertising in the german ST computer magazine (12500 exhibition catalogues 16-32 pages)

If you've questions about the exhibition, please contact Ole Marienhagen by EMAIL (marienhagen@tu-harburg.d400.de)

If you will get an exhibition stand. please contact us immediately, because many other ATARI and PC exhibitors will order exhibition place, too. Please, use this registration form for an exhibition stand.

We will send back for the exhibition confirmation and exhibition stand reservation.

Let's have a big european ATARI party.

Registration form for the 5th Elmshorner Computertage

Computer Club Elmshorn e.V.
Postfach 261
D-25302 Elmshorn
Germany

Registration for the 5th Elmshorner Computertage
on 29th/30th Oktober 1994

ATARI-Club/Company : _____

Our address is:

Street : _____

ZIP-Code : _____ City : _____

Country : _____

Telephon: _____ FAX: _____

Please contact Mr./Mrs. : _____

Exhibition stand : Length in m : _____

Width in m : _____

We will show following computer systems : _____

_____

We will show following software products : _____

_____|

Date, City : _____ Signature : _____
Company stamp

Hint : The put up of the exhibition stand will begin saturday
29th october at 9am. The put up will be supported by the
CCE e.V. The exhibition stand is free of any charge. We
hope, that you've something for our great tombola. Don't
forget an insurance policy for your hardware equipment.

837. Diamond Back 3 suggestions

Newsgroup: comp.sys.atari.st
Date: 1994-07-18 04:52:17 UTC
From: selick@acs4.bu.edu
Message-ID: <30d1q1$k7a@news.bu.edu>
Source record: 183582

After a recent experience with Diamond Back 3, I have a few suggestions for Oregon Research for the next release.

First off, with 3.1, I still can't get db3 to recognize a mfm hard drive hooked to scsi 0, lun 0 on an adaptek 4000, and a Supra host. This problem only shows up when trying to select a Spectre partition for raw image backup.

Second, it seems that it would be wise to allow for a change in the source drive, or folder, of a restore partition. Here's what happens:

I wanted to re-format my scsi 0 lun 0 drive because I found that there was 25 meg I wasn't using. So I backed up the drive to another hard drive on lun 1, and then re-formatted the drive with an extra partition. Noww, when I went to the backup drive, partition I became partition J, and so forth. I had to copy all of the backed up files to the next-up partiton for the restore to take hold. Very frustrating.

Also, it might be useful to have a backup to a fixed disk with multiple partitions. I am backing up a 140 meg hard drive to a 70 meg, and had to make a 72 meg partition to back up the drive in one pass. Perhaps you could make it format from partition I onwards until it is done, splitting files, etc. That way, I could make 16 meg partitions, and DB3 could just back up to each partition in order I, J, K, L, M, N ...

You could even make a little dialogue box to select which partitions, and folders to go to, in order.

Hope to see some of this in the next release!

839. HD Directory is munged - can Diamond Edge Save Me?

Newsgroup: comp.sys.atari.st
Date: 1994-07-18 06:52:29 UTC
From: mbaffoni@farad.elee.calpoly.edu
Message-ID: <1994Jul18.065229.165801@zeus.aix.calpoly.edu>
Source record: 183584

Well, it finally happened. My C partition's directory got
corrupted, and now diamond Edge tells me that I have 9000 or so lost
clusters.

My question is this: Does the Medic look for the image file that I
have been so faithfully saving so that it can reconstruct my directory
from my last coherent DIMAGE? If not, _why_ not? I do not feel like
going through 4.5MB of lost clusters just so I can save the text files (and
there is no way I'm going to check if the recovered chains are executable).
The image file, even if it isn't completely up to date, will be a whole lot
more accurate than renaming those 4.5MB of files.

Is there a way I can just copy the image file back to the dirs?
Unfortunately most of my utilities were on my C: partition (of course), but
luckily I kept D.E. on my (noroach) boot disk.

Before someone points out (quite intelligently) to RTFM, I just
moved home for the summer and my manuals are quite literally buried under
a pile of junk ... er I mean my personal effects.

Direct responces from Oregon Research would be most welcome (hmm,
I seem to remember that D.E. changed hands - if so, their current tech.
support people would be most welcome to put in their $2 worth.)

If it makes any difference, my program says it is Version 1.03.

Thanks,

Mike Baffoni

They still are making good Amiga games - Desert Strike, road rash
and John Maddens football being some good currently available ones.

Even better, FIFA soccer and Jungle strike are on the way.

Electronic Arts supported the Amiga from day one. They didnt wait to
see if it took off or not.

> Electronic Arts started as a small shop that produced really cool software
> (ARCHON, PINBALL CONSTRUCTION SET, etc.) and supported everyone equally.

Yep, and MULE!!!!!!!

> Then they degenerated into a chop-shop for quick hacks (RACING DESTRUCTION

I liked Racing Destruction Set, it wasnt the most advanced game
graphics wise but it had lots of playability. Games like HARD HAT MAC
stunk though......

Forwarded from the MiNT list:

This bug has already been reported and fixed. The latest libs (PL45),
which will hopefully be sent out in less than 15 minutes, contains a
fix.

By the way, I *don't* read the newsgroups much these days, so I
greatly appreciate the forwarding of this report (and any others that
may show up there in the future).

No there is not a lot of piff-paff about DMA chips, I have replaced
6 so far all C025913-38...

You don't even give the new part numbers...

>had DMA problems and have fitted/changed DMA's in all of them. The best
>results are obtained in the end with "old" DMA chips, very short DMA
>leads - like 6" and ICD HA's and s/w.

Sorry I don't believe you, and most people could not even use there hard drives
with 6" leads...

Also I do think that Atari should know more than you, well they made the
machines....

: What's a 2080 ST? I've never heard of one of those here in the States!

I don't think it's much different from a 1040 ST. It has 2Mb installed on
delivery and the name-tag says 2080 instead of 1040 :-)

I was told that Atari was trying to sell 2080's instead of Mega 2's when
I was about to buy my computer so I bought a 2080. Bad choice.

:I just recently tried playing ECO in my Megs ST2 again with no success.
:It won't go past that Darwin screen. Someone told me that I should have
:write-protect off, but this didn't help. What's going wrong?

I managed to get Eco working on my STe by hacking around a little. I can't remember exactly what I changed, but you have to run Eco from inside a debugger (I used MonST), wait for the Darwin quote screen to appear, and then break out. You'll find its in a fairly tight loop waiting for something to happen (sorry, a bit vague here.) You have to start the programming running again just after the loop, and you should soon be evolving!

It's also possible to patch the loop (I seem to remember its just a one-byte change) such that it terminates. Then you can run Eco straight off without messing around with debuggers anymore. Sorry, I can't remember what I changed anymore, perhaps I have an old copy on my HD I can compare with the original.

Now Eco is quite a nice game, but I was rather suprised to see it at atari.archive, since I'm sure its a commercial release by Ocean. (At least in the UK.) In fact I'm sure I remember seeing reviews in ~1985 when it came out. Anyone know the commercial status of this game? Did the programmer release it to the public domain, maybe? Or has atari.archive become a WaREZ site?

Hi all!
I'm planning on selling some of my Atari equipment, and was wondering how much I would realistically be able to ask for it.

So, without further ado, how much do you think I can ask for:

1) Atari TT030 with Monitor (i believe PTC1426)
2) 1040 Stf with Sc1224 Monitor and bunch of software (originals of course)
3) A roland 9-pin printer (can I get ANYTHING for this?)

Thanks for any suggestions!

It doesn't matter if you only print text. It's just when you print graphic
you need a special HP laserjet driver.
But you should be able to see if the printer receives anything on the led.
If not, you got a real problem 8-/

Is your BBS Theo Runia's Board?? Just wondering, as if so he is in NeST and I
can easilly send the file through to him. Let me know, or advise the BBS's
NeST address and I'll get the file over same day.

If you have already have anything reliable that will work between a Mega 4ST
(running a mail only fido system), and a Falcon running Internet and CIX (part
time), in the background preferably, then please let me know.

If I remember correctly MikeNet prooved unreliable, and LittleNet had a drive
conflict with one of my hard drives on the mega ST4 (I have up to drive P: in
use). Preferably I'd like to use the MIDI ports, the parallel, or the ROM port
if possible.

Looking forward to your reply.

>greatly appreciated.. thanks!

Why not go a step further and go for a Mega STE (mind the 'E'), this machine comes also with a detached keyboard but has extra advantages like a built in harddisk (SCSI), extra serial ports, double processor speed (16 MHz 68000 with cache) and the STE stereo DMA sound system. There is also a VME slot for graphic cards or anything.

Another step further is the TT, it has a 68030 processor running at 32 Mhz, added graphic capabilities (640x480 in 16 colors on a 'standard' VGA monitor) a real SCSI bus (external and internal) and it's memory is expandable to about any size you want (max 8 Meg ST-RAM and a few Gigabyte of FAST-Ram...) If your in for serious DTP stuff you can hook up a 19" or 21" monochrome monitor running at 1280x960 in monochrome at 70 Hz. It also has the VME slot.

The TT has the 'slight' disadvantage of being far more incompatible with the ST software range than the Mega STE which, once switched back to 8 Mhz and with the cache turned off, runs almost all the older software without problems.

And of course there's the Falcon, the youngest of the Atari family, it's not the fastest machine but it has some nice features like:
'TRUE' color RGB modes (maximum 65536 colors at once on screen)
a quite flexible video system which can be set to work on TV, RGB, VGA and Super VGA monitors. It also uses a 68030 processor but only running at 16 Mhz. Some other features are CD quality sound (16 Bit stereo at 50 kHz) which is assisted by a DSP processor running at 32 Mhz, you can do real time sound conversions like filtering, modulating, mixing etc. Sound can be put in directly through a microphone input. Memory expansion is limited to 16 Mb of which only 14 Mb can be used, third party products are already available to break this barrier (by using the same Fast-Ram technique as the TT) The Falcon is placed in a 1040ST casing... Too bad for that..

So, if it is compatibility with the oldest ST's you want, go for a Mega STE, if it's speed you want go for a TT and finally if you want to do some heavy graphic and sound stuff, get a Falcon...

Gert

Yeah, it definitely doesn't like some software. At least on my MSTE. :-(

>I've found that Before Dawn will not invoke when Mousa-ka-Mania II is
>active. BD thinks there is some activity. I haven't figured out a
>way around this except turning MKMII off.

I tried both of them together for a little while and didn't have any trouble. The only switches I had set were keyboard, mouse, joystick, and modem 1. I gave up on both, though, so maybe newer versions don't work (1.25 for BD, and I don't know which MKMII I had).

> (I didn't like this myself, it doesn't feel "right", but then again, I've
> yet to drive in similar conditions in a car.... :)

Far-too realistic? Hmmmm... It seems like there are people who like "games"
games - and people who like games that more or less feel like the "real
thing"...? F1GP is one of a kind -sim, despite the sad fact that MicroProse
haven't given their best in the ST-version. In Falcon it works finely, but not
without Backwards ST-emulator, or such program (one or both 030 caches
disabled). In ST it is a bit slow, although playable. The multiplayer option is
simply FANTASTIC! It's the thing that makes a good simulation excellent..

I think, what F1GP needs, is this:

- 4..10 players (girls and guys) in teams
- Lots of beer
- A better controller than joystick: preferably a steering wheel with pedals
and gear buttons. Well - one _can_ make such a controller pretty easily!

Believe me: games are games - but this is SO much more ... =-)

There is V2 coming out soon - but for Atari..? I doubt that. What do you think
about that, you - who (like me) have fallen in love with this game..?

>] No Second Prize - motorcycle racing, 3-D solid polygon graphics, have seen

> other racing game! It's mouse-controlled, which produces VERY responsive
> gaming! The computer opponents are actually quite _good_ for a change,
> and you can choose from 6 (or 7, I forget which), drivers all of which
> have various different abilities etc....

Wow (surprise..) this really didn't impress me at all... Fast and... fast. Too fast. And where was the game? Well, I couldn't get the "feeling" driving around fake tracks on some imagination-bike. The mouse doesn't feel like "driving a motorcycle" - and, well... I frustrated and bored.

What this proves, however, is this: we seem to like very different things! I love to "forget" that I'm playing a game; I love to be "there" myself - and that isn't possible if the game is just "fun" without realism. What makes one happy, makes another sick! It isn't fair, it seems, to compare these games at all?

F1GP _could_, still be even more configurable... So you could change the cars (colors, etc) to reflect the current Formula One scene. And it would be great to have a really random weather; the rain might begin in the middle of the race (you'd just see some clouds appearing and approaching... Maybe even passing you by!), and only rain on some parts of the track..!

I'd like the possibility to drop out of the race, if you don't qualify (now that isn 't possible). All those PC-version's extra features would be useful - and the multi-player option combined with linking two or more computers together... WOW!! Just one small problem: I don't think MicroProse cares a shit about my, or our wishes.. =-(

> Mike

So be happy ;-) ! Because it works on a TT. You just have to switch the
caches off, like with Falcon. There is a tiny PD-program (something like
TT-Games..) that makes you a boot diskette for TT. It works; veni, vidi, vici!
But strangely... In a "low-end" TT it was slower than in a Falcon-030.. 8-)
(low end => no fast-RAM). Who can explain that..?

I'm using Data Diet 2 and I haven't had any noticable problems.
I am not sure about Data Diet 1, but Data Diet 2 allows the work drive to
be assigned to a Ram Disk, and also uses a virtual ram drive for other
work.
As far as Datalite, if your software works, stick with it (or
upgrade) You know, "If it ain't broke, don't fix it"

I have a TT with NOVA 16M and BD works ... when NOVA lets it (I tell
the internal screen blanker that comes with NOVA to be set to "0" but it never
saves the "0" so next time I boot, I may hear the music playing but I never
see the BD modules <shrug>). I have yet to have BD freeze - in MTOS or out of
it.

I've never used DATALITE, but I use Data Diet v2.1, and it works like a charm. Easily configurable so you can avoid conflicts and plenty quick for my needs. You can turn compression on or off at will, and configure compression by path, extension, or individual files. Also, Keith Gerdes continues to support it and will release any improvements he makes in the future. I think he's planning on something in the next few months, but don't quote me on that (I had a message from him, but I lost it...).

: the Atari scene... what are the different Mega ST models available? (I
: know these weere the ones that had the CPU and keyboard seperate like a
: PC or Mac), and how much do they run used these days? Any info would be
: greatly appreciated.. thanks!

Umm, lets see I have just built an atari system from scratch over the
last month or so. I used to have a system in the UK a few years back
and kept most of my software here is what I picked up and for how
much.

Used Mega 2 with colour monitor optical mouse and some software $250

Used Mono monitor $45 for all my serious software

Used Atari 300dpi Laser SLM805 $125

I had a spare quantum 105meg drive so purchased a scsi controller ($45 new)

I also picked up a megafile 60 to use as a box to put 2 other scsi
drives I have in. This was a bit extravagent at $75 but what the hell.
(anyone whant a 65Meg RLL Drive for $30 + shipping?)

I have just picked up 2 1Meg simms a pile of wire and a soldering iron
to hack in another 2 meg of memory so I can actually use the laser
printer. ($75)

Total cost to date $570, now if I could only find a cheap graphics
card and processor accelerator.

Congratulations on buying the BJC-600! It's an excellent printer, and usually gives better output than the HP 560c. (I was just talking to a guy who uses both for commercial-quality output...) If you have access to Genie, try Softlogic's roundtable libraries. If not, and you don't find a driver anywhere, let me know and I'll check out Softlogic's library for you. Let me know by email if you want me to check. (If I do find one, I can email you a uuencoded version, or send it on disk, for the cost of postage and one disk :-)

Good luck,
Tom

Strange, it works for me, with both BD 1.25 and the new version 1.38 (just uploaded to a.a.u.e a few days ago). I load dawnauto.prg before automous.prg in my auto folder.

BTW, there is a cool new "bouncing hole" image of Star Trek TNG, with two mods of Picard speech. It is currently on ftp.uni-kl.de, and will soon appear on a.a.u.e.

I grabbed the game (it works fine on both my Mega2ST and MegaSTE, by the way)
and I cannot find anything mentioning PD or Shareware status. In fact,
it seems to clearly be copyrighted by Ocean. I would swear that I remember
reading some text about this game years ago (including the instructions, which
I do remember :-), but there is no such file included in the archive, so I
must assume that it is not publically distributable.

Well, it was just a guess. Maybe is damaged or most likely there is
another faulty chip besides the GLUE. Have you checked the RAM?
Take out the SIMMS and place only half of it. Then power up the machine
and see what it does.

Better still you should try to get it to a technician.
Speculations like these won't fix your machine...

I've been using DataLite 2 on my FM for a few months now and so far
have not detected any problems. I have about half of my partitions
compressed, leaving the boot and comms partitions uncompressed.

Hi,

there were lately a DIY-EPROM programmer in a german Atari Mag.

But I'm sure there are several commercial produkts, f.i. from Heim-Verlag.

What about a programmer for V.24/RS-232 ??

Repost: Sorry if you got this message twice, the mailer at Newcastle
has been acting up.

I heard from Karl Brandt (System Solutions) that he is now selling
the PAK-030 Accelerator Cards in the UK.

He is offering two versions:

1) 68030 @ 32MHz
68882 @ 32MHz
32Kb CPU Cache
TT/TOS 3.06

Price: BP 399 inc VAT (Fitting BP 50)

2) 68030 @ 32MHz
32Kb CPU Cache
TOS 2.06

Price: BP 299 inc VAT (Fitting BP 50)

He will be demonstrating these systems at the next Atari Shows in
the UK. Perhaps more of interest to the power users will be the MEDUSA
system. If you want to benchmark that beast, bring your apps.

I have nothing to do with System Solutions except as a satisfied customer.

912. Fitting double-sided disk drive to old 520STFM

Newsgroup: comp.sys.atari.st
Date: 1994-07-19 12:03:35 UTC
From: sffc1@central.susx.ac.uk
Message-ID: <30gfen$a4a@infa.central.susx.ac.uk>
Source record: 183547
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Are there any possible catches anyone knows of to watch out for when fitting a double-sided floppy drive from a 1040STF to an *old*-style 520STFM which previously had only a single-sided drive?

I assumed this would be completely simple, but tried it yesterday and the drive at first acted as single-sided, then eventually wasn't recognised at all.

Cheers,
Matt

PS - Where can I find a FAQ for this group (pref. in the UK)?

: > compatible with the ST? Can DOS's format utility format a disk for the ST
: > if I know the correct track/sector info?
: >
: > Any tips would be appreciated.

I have perhaps the first version of TOS and SS-floppies. What I found out
while testing with them a little, was that TOS will not understand a
floppy using one sector / cluster - and DOS 5 will not understand
two sectors / cluster. At least in my boxes. So to move files around they
need some tricks : if I copy from dos to atari, it's fine. Atari simply
reads with the file length info fine and imagines that the extra jumps in
fat are an error.
But copying from atari to dos the fat markings end too early .. so I
usually connect the text file behind itself and save in atari ( with
double length ). So it wirtes twices as many clusters on the disk. And
now they are enough for dos to read it all. But in between I have to
change the length on directory to the original.

Just my experience... nothing to blaim the systems. Both are good.
Hannu.

Storm (v1.02) is a Shareware term program from Alan Page. It runs in GEM with everything, even the terminal screen, in windows. It's lightning fast works great (well, almost; there is a problem with zmodem...). Alan has been busy with his "real" job lately, but apparantly he is planning on getting back to Storm fairly soon. I recommend you check it out; in some ways it's better than Connect. You should find it in almost any library (archived, and don't forget to get the patches from 1.0->1.01->1.02 and zmodem ->1.02). BTW, Alan Page wrote the original Flash (up to v1.6) which was so popular for so long - Storm blows that old Flash right out of the water.

Regards,
Tom

An oldie but a goodie! Atari 520 ST with two floppies and color monitor requires a good home. Perfect working order.

This system is in daily use by my daughter, but she wants to run the same software that her friends run (windows - yuk) so I am selling this system to buy her an IBM compatible.

I realize the system isn't worth too much, so send reasonable offers via email (I don't read this group!!). I would like to get enough to cover what I spent recently on the Atari color monitor (about $200) for the entire system. I will ship the system (at your expense!) anywhere in the US.

922. "Reach for the Skies" works on Falcon030?

Newsgroup: comp.sys.atari.st
Date: 1994-07-19 17:45:45 UTC
From: patmc@ch.apollo.hp.com
Message-ID: <Ct7809.Ls8@apollo.hp.com>
Source record: 183460

Howdy,

I recently got "Reach for the Skies", a flight simulator/game
which was listed as working without problems on the Falcon 030 in
Heikko's (?) list. I haven't been able to get it to work.

I've tried the following:

1. Running from floppies
2. Running from hard disk
3. Running from hard disk with all acc's & auto's removed
4. Running from floppies using backward

Using backward and floppies, or running from hard disk with the bus
set to STE mode (with FalconSX) gets the game to work partially - you
can actually get flying by selecting "pilot" mode and then "intercept",
which puts you in the middle of a dogfight. If you select "takeoff"
from "pilot" mode, after the copy protection check is over, the engine
noise sound starts and the game locks up.

Has anyone gotten this to work on the Falcon, and if so how?

Thanks,
Pat McElhatton

-=- 3 Tempest 2000 Cartridges -=- to give away at the CAIN Atari Fun Fest.

There will be other prizes being donated to raffle off at the show.

If you aren't doing anything on August 7, 1994, you may want to stop by
Kirtland, Ohio for one of the greatest Atari gaming shows!

CLEVELAND, OHIO is within 500 miles of half the population in the United States
and a very LARGE population of Canada.

The CAIN Atari Fun Fest 94 will be held in Kirtland, Ohio (very close to
Cleveland) and will allow Lynx and Jaguar owners to have a lot of fun!
There will even be a "Cleveland Lynx-Up" where Lynx owners can bring their
Lynx and game cards and comlynx with other players! Who says that you'll never
get the opportunity to comlynx???

There will also be dealerships attending this show that will be more than
happy go give you great deals on game systems and game cartridges!

If you are an Atari computer gaming fanatic, not to worry! There will dealers
there to supply you with all your computer gaming needs...

ALL INTERESTED ATARI DEALERSHIPS AND USER GROUPS SHOULD CONTACT THE SHOW
ORGANIZERS AS SOON AS POSSIBLE! Great spaces are on a first come basis!
Atari user groups are given tables for free!

PLEASE distribute this on BBSs, networks, and at your user group meetings!
We want to have one heck of a gaming day! And a gaming day that might be
closer to you than you think!

CAIN Atari Fun Fest 94

Since you mentioned Darek Mihocka, you might like to know that his current schedule calls for him to attending the Mid-Indiana ST MIST AtariFest VI at Indianapolis, Indiana, on Saturday, July 23 (10-3 CDT/EST) at the Best Western Waterfront Plaza Hotel. It's just off Interstate 465 at the Speedway Gribnif will be there with NeoDesk 4 demonstrations (although the product won't be ready to ship until manuals are complete in about a week). Craig Harvey of Clear Thinking will be there with an EdHak upgrade he calls Edit-Plus. And there will be at least a dozen other vendors/developers such as Binary Sounds from Texas, It's All Relative from Missouri, D.Brumleve from Illinois, MegaType from South Bend, Ind.... and many user groups. Admission is only $3 for this premiere Midwestern show. It's the place to be!

927. Chroma24, is it out yet?

I saw a ad for Chroma 24 in a german magazine, and wonder if it's been released yet???

Where can I order it from (preferable in UK!)... how much will it cost... and so on!?!?

The german ad had a price tag on 300DM (~150 UKP).

For you who don't know: Chroma 24 is a VERY good GFX program for the Falcon, what I've seen of it, it's well worth the price!!!

>Could anyone also explain why a program that works fine on 2M STe's won't work
>on some 4M STe's despite not making any different use of memory?

Some programs do not understand that screen memory lies at the end of the
memory. On a 2 Mb machine it will use up the last 32k of memory, any write
beyond that 32k lands in the unused 2Mb zone behind the real 2Mb of memory.
As the ST(E) generates DTACK (memory acknowledge) signals for the whole 4Mb
it won't do any harm. But when 4 Mb is present, writing beyond screen
memory lands in unused space and the system gives a 'bus error' (bombs
away..) I had several programs which did not run properly on a 4 Mb system,
by writing a small loader program which set up a new (larger) screen
somewhere else in memory and then launching the troublesome program solved
the problem.

On my TT nowadays it isn't a problem anymore because it can have up to 8 Mb
of ST RAM and this was never possible on a 'normal' ST...

Is it just me, or should this be added to the FAQ?

Every couple of months (or so it seems) someone who's feeling jealous of
the PC and Amiga newsgroups suggests that we should create a zillion new
Atari newsgroups, as if it were some sort of competition. There are a
couple of problems with this:

1) People already cross-post inappropriately between comp.sys.atari.st
and comp.sys.atari.st.tech (like this message...).

2) Adding more newsgroups isn't going to create more traffic (except for
the inevitable cross-post-mania) or, for that matter, more interest
in Atari computers.

3) The current bandwidth in comp.sys.atari.* doesn't justify creating a
half-dozen more newsgroups.

Not really. Marpet Developments have come out with the XtraRAM +8 for the STE and Mega ST (no "E") which you plug in to a system that already has 4Megs and get up to 12Megs. You also need TOS 2.06, but what the hey...

There's a very nice review and explanation of the installation in April '94 ST Format (issue 57).

There are two instructional files on atari.archive.umich.edu that deal
with floppy drives. One is genflop.lzh, the other ibmflop.lzh (or something
like that). Grab the 0index file to find them. Hope that helps.

I am not familiar with STorm; however, I us STalker with STeno.
By activationing the Capture mode, in the Options window, all activity
online is sent to STeno. I use them on a TT030, with TOS 3.06.

Note, I use both programs as ACCs this workes around a bug in STalker that if
you use it as a program and quit and then later on reload it (without a
reboot). Steno will have a window background and Stalker will lockup
during text scrolling.

Gribnif said that they would start working on upgrading this program ater the
release of Neodesk 4.

Got it working reliably now, needed a special serial cable and then had to
drop the baud rate to 2400 to get reliability.

> Ps. I have the manual for the old (first) HP laserjet and HP laserjet II

I don't suppose you'd care to part with the first HP laserjet manual would you
Kim, can't get one anywhere.

That is not a real ST-RAM (with DMA and Video capabilities) I think.
If it would be a real ST-RAM, you would not be in need of TOS2.06!

By the way: a TT can have up to 10MByte ST-RAM (2 on board, 8 card)

ANNOUNCING BINARY SOUNDS
(Formerly Barefoot Software)
Serving the Computer-based electronic musician

Well we guess this is it!!

WE are HERE!! and the manual will be available at the M.I.S.T. show
Sat Jul-23 Binary Rick will be there live to Demo Edit Track
Platinum for your enjoyment(get yours!!)

As we get up to speed, we are checking out the various products on
the old line. But we are making available right away, Edit Track
Platinum, Edit track & SMPTE Track(Software only) upgrades!!
(SMPTEMate will be announced as soon as we can produce them!)

Edit Track & the upgrades include the Platinum manual(of course!)
We are sorry that we must sell the manual to platinum owners who do
not have them, but we will support ALL registered user the best we
can!

We are working on many exciting products , both software & hardware
to fulfill the needs of the home studio musician at an affordable
price. We will not say more till we get ready to make announcements!
We are available online on Genie & Delphi so feel free to ask
questions.

Best of all we will have special "Honeymoon" pricing in effect
until October-31-94!!!
As of this time we are not accepting credit cards, so send check or
money orders(faster) and order yours today!

List Promotional Sale
Price discount price
----- -------- -----
Edit Track
Platinum 7.1 $150.OO $50.00 $100.00

Edit Track & SMPTE Track(software only)
upgrade from 6.-7.1 $70.00 - $70.00
pre 6.-7.1 $95.00 - $95.00

Platinum Manuals for Platinum owners only!!
$18.95 plus shipping
(All prices U.S. Dollars)

Version #'s can be found in the manual and by checking the Desk dropdown menu
of the program. (Version 6 is Gold, all other versions are same for pricing)

All prices are subject to net shipping and UPS charges. Texas residents must also include 8.25% sales tax. Avoid COD charges by sending check or money order. Allow 7-10 days for personal checks, orders paid by cashiers' check and money order will be shipped immediately upon receipt or as soon as stock is available.

For orders and support we may be reached online at:

Genie - B.SEMAAN or R.LADAGE
Delphi - BOSEM or BONDSERVANT

Our phone #'s and hours for orders and support are:

Bob (713) 499-3129 6-10 PM Central, TUE-FRI. (Other hours, potluck)
Rick (713)776-9118

I will admit, EA made a brilliant job of Dpaint ST - Much better than
the Amiga or PC version. (Just a little buggy ,s'all).

Chris `Sunny Side Up' Fuhrman (cfuhrman@csugrad.cs.vt.edu) wrote:
: ST Review did a write up back their March issue. According to
: them the spell checker HAS been improved (along with ASCII export). I'd
: personally love to see more info on TW3 as I'm considering a higher end
: word processor than what's included in AtariWorks.

I feel that That's Write 3 is a tremendously capable program.
Additionally, Compo offers some pretty incredible support (they call me
back, answer my questions, send me disks with drivers, fonts, etc...
My only complaint about TW3 is that it is a pain to install and set up
properly. Assuming you want to change anything (such as the fonts in
your system) or use a driver that is not included - you have to be in for
the long haul. Many of the features/flexibilities of TW3 are
undocumented (and thus, you have to pester Compo). I'll try to post a
review as soon as I write one for our newsletter. Any questions gladly
answered.

Well, see, that's the thing. I have _EVERYTHING_ compressed by Data
Diet except my auto folder (which is Squish compressed). Remember that
Data Diet comes with DC Squish so that all of the programs can be compressed as well. In general, I am getting about
25% more space than before (100meg->125meg). Actually, ther are a few
files here and there that I keep uncompressed; these amount to about 20k
worth and are therefore insignificant.

: Far-too realistic? Hmmmm... It seems like there are people who like "games"
: games - and people who like games that more or less feel like the "real
: thing"...? F1GP is one of a kind -sim, despite the sad fact that MicroProse
: haven't given their best in the ST-version. In Falcon it works finely, but not
: without Backwards ST-emulator, or such program (one or both 030 caches
: disabled). In ST it is a bit slow, although playable. The multiplayer option is
: simply FANTASTIC! It's the thing that makes a good simulation excellent..

: Believe me: games are games - but this is SO much more ... =-)

: There is V2 coming out soon - but for Atari..? I doubt that. What do you think
: about that, you - who (like me) have fallen in love with this game..?

: What this proves, however, is this: we seem to like very different things! I
: love to "forget" that I'm playing a game; I love to be "there" myself - and
: that isn't possible if the game is just "fun" without realism. What makes one
: happy, makes another sick! It isn't fair, it seems, to compare these games at
: all?

Ahem, how can you possibly forget that you're playing a game when
you have to switch disks every five minutes (4 disks, non hard drive
installable = diminished enjoyability). I also find it difficult to
enjoy a driving game that slows down dramatically if there are any other
cars on the track (and I am running at 16mhz!). Also, the sound is, well,
inexcusable.
Now Stunt Car Racer, that's a game... (Also by Geoff Crammond of
Microprose F1GP).
Maybe I'll pick up F1 again when I get a Turbo 25...

Hi Christian,

I would like to know what kind of spell-checker you include in Papyrus? Is
it an algorithm-based or a dictionary-based? Does it handle exceptions
correct, e.g. the german Schiff-fahrt or Maus-taste? Are there other
spell-checkers for french or english?

Thank you much for your reply.

: What's the minimum HW/TOS configuration for AtariWorks?

Not too sure, but I think you definitely need a hard drive. AW should work on any TOS, but a min of 2Mb is needed, and so is Speedo GDOS to make the most of the program.

>
>That is not a real ST-RAM (with DMA and Video capabilities) I think.
>If it would be a real ST-RAM, you would not be in need of TOS2.06!

Thands for pointing this out! I didn't mean to imply that it is like just
plugging in 12 megs, only that you can get 12 megs out of a Mega ST or an
STE. There is, BTW, a utility that comes with it which alters the header
information in *most* programs so they can use the extra memory. I don't
know about DMA or video, but it's obvious that using 12 megs this way isn't
as simple as 10 megs on a TT. :-)

A.C.T. Now
Atari Community Together Now

Lynx Letter Writing Campaign

First Campaign Focus: Lynx Distribution

Len Stys (aa399@cleveland.freenet.edu)
A.C.T. Now Organizer

INTRODUCTION

The Lynx is an incredible portable video game system. The Lynx is the only portable video game system on the market today with a 16-BIT graphics engine (the others have 8-BIT). The Lynx radiates 4,096 colors (more than any portable on the market today). The Lynx has a 10 percent larger screen than its closest competitor. The screen is also recessed and back-lit for better viewing. All of that, plus stereo sound, a battery saver option, and the largest selection of multiplayer games in the world!

The Lynx and its related products, however, cannot be found in any stores! Maybe the reason why the Lynx cannot be found in stores is because of poor marketing of the product in the past. Maybe it is also because Nintendo and Sega are retailers' favorite companies due to the Super Nintendo and Sega Genesis. For whatever reason, you cannot walk into one major retailer and buy a Lynx game.

Atari Corporation will not release sales numbers for the Lynx. But it is believed to be close to 1 million. This number isn't bad at all. And if you think about it, there must be demand for at least one major retailer to sell Lynx games!

ONE RETAILER ONLY

This campaign will be concentrating on only one major retailer to carry the Lynx and its games. Why only one major retailer? Right now, there is no more room for more than one major retailer to carry the Lynx. If we were to concentrate on several stores and succeed in getting them to carry the Lynx, the following would happen:

Atari Corporation would concentrate on the Jaguar with most of their advertisements. There would be a few Lynx magazine advertisements, but not enough to create a real large demand for the product and its related products. All of the major retailers that we convinced to

carry the Lynx would have mediocre sales, not fantastic sales since Atari's advertisements only created so much demand. Since demand for the Lynx and its games in all of the stores were mediocre, all of the retailers would decide not to carry it next year.

But if we concentrated on one major retailer to carry the Lynx and Atari advertised the Lynx in gaming magazines, the retailer would have fantastic sales since they are the only place to buy the Lynx and its related products. The retailer would most likely be impresed with the sales of the Lynx and decide to carry it next year.

And then next year when Atari has more money from its Jaguar, the company will be able to promote the Lynx more heavily which will allow Atari to increase distribution of the Lynx.

So if Atari will have more money to promote the Lynx next year, why not just wait until then? The reason we cannot wait until next year for the Lynx to get into more retailers is because there will not be a next year if the Lynx does not retain market presence this year. The Lynx will be nearly impossible to re-introduce into the marketplace next year. This is because retailers will see it as old failed technology that is being re-introduced into the marketplace. There will also be too many new video game products being released next year that will be competing with the Lynx for shelve space.

It is important that the Lynx stay in the marketplace this year and show good sales at one major retailer.

The major retailer that I have chosen for us to concentrate on is Toys "R" Us. I have chosen this retailer because it is the largest toy store and it can be found everywhere in the United States. It can also be found in other countries as well.

TOYS "R" US

Toys "R" Us is the top toy retailer in the U.S. in terms of estimated dollar share of the industry. The toy retailer finished first in a study conducted by NPD Research in 1991 and is probably still first in 1993. Toys "R" Us stores are also very large and is probably the only retailer which will be able to carry most of the games available for the Lynx.

All of the letters will be addressed to Charles Lazarus, Chief Executive Officer and Chairman of the Board of Toys "R" Us. The key to getting the letters to Mr. Lazarus to read will be for each of us to make the envelopes look as professional as possible.

The letter to Mr. Lazarus at Toys "R" Us should include:

Dear Mr. Lazarus,

1) How much you like Toys "R" Us
2) How much you like Toys "R" Us because they support the quality products that customers buy from them

3) How much you like your Atari Lynx
4) How you bought your Atari Lynx from Toys "R" Us (if true)
5) How you cannot find any games for your Atari Lynx
6) How you believe there is a demand for Lynx games since nobody else is selling them
7) How you noticed that Toys "R" Us is carrying the Jaguar 64-bit video game system and how you appreciate it.
8) Thank Mr. Lazarus for reading your letter and for considering carrying the Lynx and its quality games once again

The letter, of course, should be written as professionally as possible.

The address of Toys "R" Us is:

Charles Lazarus
Toys "R" Us Inc.
461 From Rd.
Paramus NJ 07652

(you may want to write "Important" or "Personal" somewhere on the envelope or if you think the envelope looks really professional, you may want to try it without it)

ATARI CORPORATION

Atari Corporation is the maker of the Lynx. The company does not seem to know what to do with the Lynx or its game cards right now since there is no major retailer carrying the product.

The reason for writing Atari Corporation is to inform the company that you have written Toys "R" Us to encourage them to carry the Lynx and to thank them for carrying the Jaguar. The letter will encourage Atari to contact Toys "R" Us and attempt to convince the retailer to carry the Lynx once again. The letter will also inform Atari Corporation of ways they might be able to convince Toys "R" Us to carry the Lynx.

All of the letters will be addressed to Sam Tramiel, President of Atari Corporation. The key to getting the letters to Mr. Tramiel is by making the envelope look as professional as possible.

The letter to Mr. Tramiel at Atari Corporation should include:

Dear Mr. Tramiel,

1) How much you like the products that Atari Corporation produces
2) How much you like the Lynx
3) How you have written Charles Lazarus of Toys "R" Us in order to encourge him to carry the Lynx and its games again
4) How you have also thanked Mr. Lazarus for carrying the Jaguar
5) How you believe that Atari should try to convince Toys "R" Us to carry the Lynx again this year
6) How you have a few suggestions which may help Atari convince Toys "R" Us to carry the Lynx again (OPTIONAL):

a) Inform Toys "R" Us that they will be the only major retailer
carrying the Lynx and its games this year
b) State the amount of Lynx owners in the world that are looking for
Lynx games
c) How Atari can advertise the Lynx and ALL of its games in video
game magazines and that it is available at Toys "R" Us
d) How Atari can advertise the Lynx along with the Jaguar in
Toys "R" Us Sunday newspaper ads
e) Lower the price of the Lynx base unit and Lynx Deluxe package
and give a free Super Asteroids/Missile Command game to encourage
sales of the portable
f) Restructure the pricing of Lynx games
g) Stress to Toys "R" Us that the Lynx will be used in future
multiplayer Jaguar games
h) Review all of the Lynx games and sell only the highest quality
Lynx games at Toys "R" Us this year

7) How you would really like for Atari Corporation to release new Lynx
games for distribution at Toys "R" this year
8) Thank Mr. Tramiel for reading your letter and for attempting to
convince Toys "R" Us to carry the Lynx again

The letter needs to be as professional as possible in order to get the best
effect. Try to concentrate on only the things mentioned above.

The address of Atari Corporation is:

Mr. Sam Tramiel, President
Atari Corporation
1196 Borregas Avenue
Sunnyvale, CA 94089

SUCCESS OR FAILURE

The success or failure of this writing campaign depends on you.
If you are serious and write these two companies, there is a good chance
that our goals will be reached. If you don't bother to write because
you either do not have enough time or you think someone else will write,
the letter writing campaign will be a failure.

Another important part of this letter writing campaign is to distribute
this text file. Upload it to online systems, computer networks, BBSs, etc.!
And print it out and encourage your user group members to write!

The future of the Lynx is pretty much in your hands...

>

No. MinixFS caching is performed internally, and is apparently changed
by patching the minix.xfs binary!

After all, CACHExxx caches FAT tables, and MinixFS has no FATs!!!

Of course, you'll always need a TOS boot partition, but wether you
cache this or not is up to you. Personally, I don't bother because
everything I use is on Minix partitions.

I would convert the IMG files to Degas PI3 and then use WIMAGE, a
utility that comes with the WERCS resource editor from Hisoft to
convert them into RSC files. This isn't particularly easy, or fun.

You could also try the Interface resource editor, or the icon editor
Zoom, which are both written by Shift in Germany. They are supposed to
be able to do all this stuff automatically (and import icons from
Windows 3 as well).

Vroom : made by Lankhor, a french software house. Great game, absolutely funny to play, I spent many and many hours on it. Really worth buying. Sadly, it's more "arcade" than simulation.

Formula One GP : great on a powerful PC, dunno on an ST. Seems to be good however, since many atarists bought it and were happy

NSP: Very fast 3D routs, high controlability, but absolutely not realistic for the driving - I
can tell it, I drive a motorbike ! -.

> half-dozen more newsgroups.

Agreed. I've been following this thread and I still can't see the rationale for wanting to have a several more atari-related newsgroups to wade through. The three we have (st, tech, advocacy) seem to be more than sufficient for the minimal amount of traffic that is generated every day and adding more groups will simply exacerbate the cross-posting problem we already have.

If someone _really_ wants to do this, go right ahead. I won't vote for it but if it passes (and such CFV's usually do due to knee-jerk responses) I simply won't bother subscribing to them nor will I forward their contents on to GEnie like I do the st and tech groups. It's enough work as it is now.

Just my $.02.

God it's slow, even on a Falcon! I mean 2 minutes to compile 80 lines!
{{{ Dan }}}

tcsh

! 9. Editor (eg. Gulam microEmacs)?
Edith

I reckon it's virtually impossible to do any even medium-sized stuff
without more than 4Mb RAM. Outside is particularly impressive in this
regard - the slowdown is not really noticeable.

ATB,
Simon.

Sorry haven't got it yet. But I'll describe the setup that I will
have when I'll get it :-).

>1. System type (eg. 1040STfm)?
>2. Memory (eg. 4Mb)?
>3. CPU speed? (eg. 8MHz)?
>4. Hardware CPU accelerator (eg. none)?

Same.

>5. Disc capacity (eg. 30Mb - yes I need to upgrade)?

120MB (3 old, slow drives).

>6. TOS version (eg. 1.4)?

KaosTOS 1.4 (a bit better than 1.4).

>7. OS Environment (eg. TOS)? others: MiNT, MultiTOS, Minix, any others?

MiNT (kernel) and minix-fs run from autofolder.

>8. Shell (eg. Gulam)?

Had it. But upgraded to PD-ksh because Gulam didn't support xfs filenames.

>9. Editor (eg. Gulam microEmacs)?

I'll miss it. I even changed the keyboard mappings with diskeditor to
suit my tastes (added shift-cursor movements etc. :-). I loved gulam
because it was so well integrated (hated it because it returned the
ROM keyboard (I had a german TOS and it has some keys in stupid
places)). Now I'm trying to get GNU Emacs 18.59 to work with my
preferences (backspace as help *uuurrhghgh!!!!*) as it has nice
programming modes (grabs 1.5MB memory though...).

>10. Anything else you think is relevant, comments, etc...

J"urgen Lock's vconsd1 (not freely distributable) which gives me
'screen' like virtuals under mint.

ST-Guide (THE hypertext, german freeware, acc/prg, inline images,
builds crossreferences automatically, from src.doc.ic.ac.uk:
/pub/packages/atari/uni-paderborn/tools/acc/st-guide/ (there's will be
a texinfo -> STG converter soon too)) for viewing all kinds of
documentation & texts.

Elvis

>10. Anything else you think is relevant, comments, etc...
I use a very similar setup at work, but on a Sun 4/660. Except for the speed,
working with the Falcon is extremely similar. I like this compatibility.

G++ version 2.5.8. Earlier versions use less and less memory
the further back you look. More bugs and less features too :)

Mupfel 1.2 (from Gemini 1.2)

> 9. Editor (eg. Gulam microEmacs)?
Real MicroEMACS 3.11

> 10. Anything else you think is relevant, comments, etc...

It's things like this that really show how bad the performance of a 1
MIPS machine is for compute-intensive tasks. It's a pity workstations
are so expensive, and PCs give such pathetic performance (especially for
floating-point operations).

All my GNU C/C++ stuff is distributed over two 16Mb Minix partitions
which were setup using MinixFS. The compilers, libraries, utilities
take up about 16Mb total (this includes file utils, mint utils, plus
Ghostscript fonts etc).
C++ libraries include the GEM++ library by Warwick Allison.

Source record: 183406

Would like to sale an external ST ready hard drive subsystem. It is completely enclosed in a metal case with power supply and fan. ICD controller (with clock) and one SCSI port for daisy chain other SCSI device. Currently it has about 480MB of hard drive spaces with 4 partitions (2 for ST and 2 for Spectre with Mac stuffs) all ready for plug and go.
Will consider offers.
Thanks
Tang

I am looking for the 1200 baud modem produced by Atari Corp,
the model number was SX212. It had both an RS232 port, and a funny
looking SIO port on the back.
Please email me if you have one you wish to sell for a reasonable price.

Thank you.

Well after playing with a Demo version of Coma 210
plus the early ones, it looks like it could be the best
Fax program for the Atari...

Good Points....

1. Has a built in Text Editor, I have not found this with otheres
that I have managed to play with..

2. Very Easy to use...

3. Uses IMG format for pictures, well supported for the Atari..

4. Can access Fax messages remotely, I think this is a first..

5. Works in Medium Res, some otheres don't..

6. Built in debuger..

Bad Points..

1. Doc's are all in German, a Big minus here...

2. No class 1 support, not a big minus if you buy a good modem..

3. No Voice support for Linelink modems, or any support for Linelinks..?

So have any otheres have any other Faxinfos, good points bad points..

Just my 10c worth....

Stephan Gross (1gross@rzdspc5.informatik.uni-hamburg.de) wrote:

> I would like to know what kind of spell-checker you include in Papyrus? Is
> it an algorithm-based or a dictionary-based?

It's the dictionary based spellchecker from Olaf-Michael Jahn. The german
word list has about 273000 words, and it runs on all machines with at least
2 Mb. It uses a completely new way to show errors: A special view
mode can be turned on where unkown words are indicated with a zig-zag underline.
Every page that's looked at for the first time will be completely checked
(this takes 1-3 sec on a 8 MHz machine), and this underlining is also updated
all the time while writing and editing - IMO only this makes a spellchecker
actually usable, since no spellchecker knows all the correct words
(especially in german). Since papyrus is the first program anywhere to use this method,
we took the freedom to christen it "IntelliView Correction" :-)

> Does it handle exceptions
> correct, e.g. the german Schiff-fahrt or Maus-taste?

Do you refer to hyphenation exceptions? There is no hyphenation information
in the dictionaries, but we plan to support a hyphenation exception dictionary
for the words the algorithmic hyphenation goes wrong.

> Are there other
> spell-checkers for french or english?

I just packed dictionaries for American and British English for HiSoft that are
based on word lists from Proximity Software. We haven't yet decided how to make
these dictionaries available in other countries.

I'm still looking for a french word list. Anybody reading this who can license one
for us? (on parle francais)

BTW ASCII lists can be used too, for those who have PD word lists

The HP does not use Epson printer codes, but it should understand
standard ASCII text (at least US models do... Don't know for sure about
UK models). Try addressing the printer at various baud rates from 2400
to 19.2k.

Depending on the age and model, the printer should understand some
implementation of HP's PCL (printer control language). You should have
HP laserjet as an option in most software. If not, try using a Deskjet
driver. That's probably the closest one to the Laserjet series.

Another little Hard-Drive tip I've found.....

Often, when using the ICD-Booter, holding down ALTERNATE won't always boot from the AUTO folder of the disk in drive A:. So, to fix this problem, do a keyboard-cold reset (Control+Alternate+Right Shift+Delete), and then when the drive light blinks off for the 1st time after the reset hold down ALTERNATE for about 2 seconds (Until the hard-drive blips and stops), and about 95% of the time, the AUTO folder will be booted from, not just the boot-sector!

Turning the machine off & on again never seems to work....

(Small variations work as well, but this seems to be okay....)

I know the feeling...
As for Storm or Connect, I'm in the same position, but I'm going to wait until the end of August to decide; Storm is my first choice, but I'm waiting to see if Alan Page works on it some more. Apparantly he's been just swamped with his real job, but is planning on working on it some more come August. If he does, I'll be registering, if not I may have to transfer some money for Connect. I wish we had better software support on the Atari (or that I could afford a Mac...at least then I'd get mostly-supported software. Oh well.).

[Article crossposted from
comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale.computers.other]
[Author was Jeffrey J. McWilliams]
[Posted on 20 Jul 1994 21:22:14 GMT]

I am looking for the 1200 baud modem produced by Atari Corp,
the model number was SX212. It had both an RS232 port, and a funny
looking SIO port on the back.
Please email me if you have one you wish to sell for a reasonable price.

Thank you.

Julian plus otheres that put files on Archive sites, Please Please could you rap them up with say LZH/ZOO or ZIP, this is because TOS/PRG/ACC/TTP and MSA extensions can't be access via most Gopher servers, this due to Admin staff not setting up the Tables to reconise these extensions as Binary files...

The same I have found with Jpeg files, Gopher servers think these are Text files and not <Picture>...

OK, I'll see what I can do about English versions of Gemini. I don't
promise anything, but I will follow this up with the author. Here in
Britain, we have an excellent UK support system for a variety of
foreign software, mostly being converted to English. Gemini seems good
enought to have UK and English support.

Connect, and it's english versions are "sold" by System Solutions in
the UK. They give you the fully registered version for around 30
Pounds.

That would be right. On the other hand most places have _no_ parts at
all.

>Does any one know who took over Software Supplies as the Atari service
>agent....

No one as far as I know. They seemed to drop everything including the
servicing side of the business when they dropped the Atari
distribution. The thing with Visual Tech is that they are at least
actually willing to deal with Atari machines. I don't though have any
information on how experienced they are with Atari gear.

I know one story of a firm in Auckland, which when sent a Stacy for
repair, sent it back with a bench charge of over $100 with a note
saying that it was unrepairable. When a local technician (that I know)
looked at it, it required a simple fix, _but_ the repair shop had not
reassembled it at all properly (hardly at all) and had damaged the
membrane for the keyboard where it entered the case.

>So there is not much here in the way of Service....

Yep your dead right there! :-((((

992. SCSI controller for ATARI 1040STe

Newsgroup: comp.sys.atari.st
Date: 1994-07-21 12:33:16 UTC
From: robinp@sherwood.uk.sun.com
Message-ID: <30lpuc$c5e@uk-usenet.uk.sun.com>
Source record: 183438

Anybody know where I can get a SCSI controller for my 1040ST in the UK ?

Does it need "building" or can I just buy a black box with 2 connectors - 1 to the ATARI and the other to the SCSI drive ?

Robin.

Talk to System Solutions on 081 693 3355. You probably want either an
ICD Link or an ICD Link 2. They are cables which fit between an ST at
one end, and a SCSI drive at the other end; the drive end has some
wizardry to convert Atari to SCSI.

They're also on ssolutions@cix.compulink.co.uk.

Chris Herborth (cherborth@semprini.waterloo-rdp.on.ca) wrote:
: In <2vjdqt$p8p@aiscube.AIS-Dortmund.DE>, Theo Janssen writes:

: Is it just me, or should this be added to the FAQ?

Don't know, what do YOU think ?? ;-)

: 1) People already cross-post inappropriately between comp.sys.atari.st
: and comp.sys.atari.st.tech (like this message...).

Yep, that's true. Anyway:

- i never ment to create more groups for cross-posting.

IMHO this is a problem of those "cross-posting maniacs", not a problem
of the net. But _just beacuse_ there is so much cross-posting here, it's
probably useful to have more groups. With just two most used groups here,
i believe we have a very "crossposting-friendly" enviroment.
Think about it ....

: 2) Adding more newsgroups isn't going to create more traffic (except for
: the inevitable cross-post-mania) or, for that matter, more interest
: in Atari computers.

- i never ment to create more groups to create more traffic or more interest
for Atari computers.

Seem's you really have a problem with cross-posting/cross-posters, but
as i said; Crosspostings are created by users, not by more groups.
For that reason it's IMHO not a solution to avoid cross-postings by
having only a few groups. Where is the end ? Only one group, so we
don't have crospostings anymore !!???

: 3) The current bandwidth in comp.sys.atari.* doesn't justify creating a
: half-dozen more newsgroups.

What bandwith DOES justify more groups ? 10 Articles/per Day ? 100 ? 1000 ?
and who decides which bandwith does justify more groups ?

My idea was, to create more groups, so that everybody can read and write
in sections of special interest, he or she is interested in, relating to
Atari-Computers. Just have a look now at c.s.a.s and c.s.a.s.t and count
all those "for sale ..."- or "where can i find ...."- or "what program to
use .."- articles, mixed together with articles of people who disuss
heavy programming-problems or whatever.
Don't get me wrong, it's really ok that people ask. At least that's of
course what this net is for, but why EVERYTHING in just two main groups

and than often in both groups at the same time (yes, cross-postings) ???!!!

Answer: Because there ARE only two mainly used groups !

I personally would really enjoy to have a section of which i know, here
i can read all those things about my Atari i'm interested in.

But maybe, this disussion is useless, because nobody has contacted me
yet, and i won't do all the work alone, that's for sure.
If so, we'll keep on having two mainly used groups, and you can keep
on being annoyed about cross-posting .. (sorry, couldn't resist)

cheerio Theo

996. Re: ECO

Newsgroup: comp.sys.atari.st
Date: 1994-07-21 13:43:57 UTC
From: rm03@cscmgb.cc.ic.ac.uk
Message-ID: <1994Jul21.134358.6311@cc.ic.ac.uk>
Source record: 183437

I've recieved email telling me that Eco has been released to PD by the
programmer(s), so here is the patch to make it work:

It looks like the program checks the screen refresh rate, by looking at
0xFF820A. If it's 50Hz, then the program jumps to an infinite loop (?!)
However, the program seems to work fine at 50Hz anyway, so you just have
to take out the check:
With a binary editor (tinytool, memfile, etc.) look at the ECO.PRG file,
and at position 0x502 you should see the hex bytes:
66 00 03 2E

change the last two bytes such that you see:
66 00 00 02

and then save the changed file.
The game should then work fine.
Alternatively, you may be able to run a 50/60Hz switcher program, which
should also solve the problem, but I haven't tested this.

Great. So instead of people inappropriately cross-posting to two or three
Atari groups, we'll get them cross-posting to eight. Don't put it to the
vote, in case some inexperienced people get it wrong and vote "yes" :-(

Have you told the Laserjet to use the serial port? If it is a Laserjet II
or III (I can't speak for other models) you have to do this from the front
panel menu. With the printer off-line, press and hold the 'Menu' key for
about 5 seconds, which takes you into the advanced setup menu. The 'Menu'
key can then be used to step through the menu entries, which should include
the port type, baud rate, handshake, etc. Note that changes to the setup
are only stored if you press the 'Enter' key after selecting the option
you want.

Hope this helps

Martin

On Monday July 18th at about five to four
mhsmith@ornews.intel.com (*Michael H Smith*) happened to write:

Hi!

MHS>I've found that Before Dawn will not invoke when Mousa-ka-Mania II is
MHS>active. BD thinks there is some activity. I haven't figured out a
MHS>way around this except turning MKMII off.

Have you tried to play around with the vectors and other settings?

BD is a little sensitive to the order of AUTO-progs. On my MegaSTE it
works
best when DAWNAUTO is the very first in the AUTO-folder. Ply around with
this
it might cure your probs.

BTW, which version are you using? 1.39 is the latest.

>to upgrade my version of DD, but i can't find V2.00 here in Greece.
>Thanks for your response.

DDv1 supports usage from a RAM disk, but it must run from the AUTO folder
before DataDiet, or before the accessory (if you always use that). The
reason for this is that DataDiet (first the .PRG and then the .ACC) looks
for the work directory, so if you don't have the RAM disk installed when
DataDiet runs (either PRG or the ACC), it won't find the work directory and
can't be used.

Keith also recommends using a reset proof RAM Disk to prevent data loss.

Try emailing Keith at k.gerdes@genie.geis.com for upgrading to v2.1 (I
recommend it; v2 is much better :-) You can also get Squish II which works
on executable files under all versions of TOS and is another excellent
program.

: CB>postings about games recently, so I don't bother about them.

: Isn't there a games related group anyway? Something like *rec.video.games*
: or so?

I came across this newsgroup (don't recall the precise name, but
was something like rec.games.video...) a while ago. It seemed to me
then that this group was about game consoles rather than on game
programs for Atari computers. I haven't checked that group's
rationale or FAQ, however.
While we're at this, I'd like to comment on the claim that there
is a manageable amout of traffic in c.s.a.st, and new atari newsgroups
are therefore not necessary. IMHO, whether you find the amount
of traffic manageable or not depends to a large degree on (1) how well
designed the newssreader's user interface works for you and (2) how
often you get around to check the newsgroup. For me, reading news has
become significantly more time consuming since I had to switch from
nn to tin. In times when I can read c.s.a.st almost daily, the traffic
is quite manageable for me. However, when I can only read it about
twice a week, there's no way I could keep up with it. For these reasons,
splitting c.s.a.st into about three different groups would make sense
to me.

> cars on the track (and I am running at 16mhz!). Also, the sound is, well,
> inexcusable.

I can't say you're wrong. MicroProse showed again how much they think about us Atari users... Well, most of us have 520 STs with 1-sided floppies and only half a meg RAM - they think... So why support any users of bigger machines..? Again, why upgrade to Falcon or TT, because software makers only believe in "good ol' ST" ? First, buy a ST - play with it for a while. Then buy a REAL computer, like PC, Mac or Amiga. That's the game. That's the way software makers seem to think. Who needs HD-installable games when we talk about kids' computer? I really don't like that way of thinking..... >:-(I hate it.
And I didn't like Mr. Dino Dini's attitudes towards us Atari - and especially Falcon users, either (some time ago here in Atari area..).

Well - what should we do to have quality conversations..??? Throw some bombs? No... If somebody can find a way to stop games makers treating us like some pigs or bunch of idiots... Then things might improve. By being silent we show MicroProse and others that we don't deserve any attention. Or games...
Sad, but true - I'm afraid.

But: even if that 3 disk show (one isn't needed) _is_ irritating, one fortunately doesn't have to change them while driving. Too often, however - I agree. Damn MicroProse!! The sound isn't actually great - but, believe me, it sounds pretty impressive when you turn your television's bass to maximum, treble to minimum - and have good loudspeakers. From monitor's speaker it's awful - but what isn't..? ;-)

> Now Stunt Car Racer, that's a game... (Also by Geoff Crammond of
> Microprose F1GP).

Well... I wasn't that excited. But it is a good game, if you like that sort of games !

By the way: is there any way to reach Geoff by E-mail..?

> Maybe I'll pick up F1 again when I get a Turbo 25...

Maybe a PAK 68K/3 (68030 / 32..50 MHz) would be a better idea ;-) ?
In Falcon, F1GP flies pretty impressively. Some say, even too fast...

After all, a 16 MHz 68000 isn't very much for a game of this type. Think about PC flight (or car-) sims on 286 machines 8-(Masochism, mostly..

Apparently usenet messages haven't been forwarded from CiX in recent days, so you've all been spared my comments ;-)

However I'll report the following one just in case it didn't get through:

I'm seriously thinking of getting a PAK3/33 accelerator fitted in my MSTE. This is mainly because I'd like it to run faster, and also so that I can use Virtual Memeory using something like Outside.

I'd be very interested in hearing from any users who have PAK acelerators of any type in their STs, especially if they are using VM drivers like Outside.

I'd also be very interested in hearing from users of *any* type of Atari using *any* type of VM driver.

The programs I'd want to use under VM, would mainly be MiNT/MTOS and GCC. OTOH I'd still like the machine to be as ST compatible as possible as there are other ST applications I use. However its mainly with GCC I have memory problems.

I have heard that GCC doesn't like Outside. Anybody got it to work?

Thanks

Roland.

@CiX

PS I *have* thought about buying a Falcon, but aren't very impressed with it. All the reports so far indicate the PAK3 is faster than the Falcon, and anyway many of the advantages of the Falcon I wouldn't use (sound, graphics etc), or are already built into the MSTE (1.44 floppy). However I am more than willing to listen to arguments in the Falcon's favour ;-)

> for the words the algorithmic hyphenation goes wrong.

Any chances for Finnish automatic hyphenation..? The rules are very simple, so it wouldn't be difficult for you. I know the market is small - but for us, who want to use Papyrus in Finnish, that would be great..!

By the way: can you tell me what HiSoft is doing with Papyrus in England? Our local Atari supplier has ordered his English Papyrus Gold copies from HiSoft about half a year ago - without results... =-(As I'm for one, anxiously waiting, I'd like to know why it takes so long? Is the reason maybe this: HiSoft tries to supply version 3.5 instead of some older 3.0X version - and translating 3.5 in English takes so much time?

Can you tell me (or find out) what the English version will be - and about how long do we have to wait for it..?

In the end, here are a couple of improvement-suggestions (I've used the demo a lot - and I love it ;-) :

- The cursor doesn't follow while scrolling the screen with shift-arrow or control-arrow. I guess you have already fixed that one..?

- Demo didn't work with Geneva 1.01 (problem with ruler)

- Some statistics about how many pages, words, etc would be nice.

- How about CVG support..? (for Calamus users)

- Or PostScript support..?

Well, there's little to complain. It's simply one of the best word processors ever - and I hope you'll develop it further. As long as there are programs like Papyrus, Calamus SL, Connect and Chagall - there's no need to buy a PC or Mac =-) !

Greetings,

Tommi

I am using datadiet version 1.0x. It doesn't support the work drive to be on the ramdisk , but in practice i have manage to do it very easy. I use a reset proof codehead ramdisk and it cooperates very hapily with DD. The only bad thing is that i have to loose every time, about 500kb of memory for that ramdisk...and i only have a 2.5MB ST. Ofcourse i want to upgrade my version of DD, but i can't find V2.00 here in Greece.
Thanks for your response.

>enought to have UK and English support.

The Big problem with English versions of German software is it out of date in a week/month, the English version should come out at the same time as the update, Connect is the only piece of German software that has got there act togethere, come on you Germans, stop being selfish, support the World and just not yourselfves...

COMA 220 is anothe Good program that should have English Doc's, it the best Fax program there is for Atari....

>term 2.0, which has the Kermit(which I think is how you FTP), X-modem, and
>Y-modem protcals. I know how to type in everything right(I think), but I
>Do not know why I cannot transfer stuff to MY disks. Can anyone help me?

I assume you mean that, while in the atari.archive.umich.edu (for instance)
you are using GET to d-l files to your system? If this is so, and you are
logged into an account on your university's system while doing this, then
the files you've FTPed are on the university account. You then have to use
Kermit (or zmodem, or whatever) to get them to your computer.

For instance, I log into my account on the university's VAX, then FTP files
from umich. Once I've done this, I must type "kermit serverb" to get into
binary server mode on the VAX, then use kermit on my machine to get the
files from the VAX. Incidently, this is rediculously slow, so I've taken
to using the UUencoded mail that the server at umich can send you. I then
just "type" the uuencoded file and save the results from my terminal's
capture buffer, and finally decode it with a handy program on my ST. One
of these days I'm going to figure out the zmodem server...

Hope this helps,
Tom

From: an938@cleveland.Freenet.Edu
Message-ID: <30nob7$l2n@usenet.INS.CWRU.Edu>
Source record: 183378

I'm looking for a good word processor for my ST. I have
a 1040 ST and a 520 ST (2.5 Megs in the 520). I have a 9 pin
dot matrix and a Canon BJ200. I would like to be able to use
the printers in graphics mode so that I can use fonts other than
the printer font. Is it possible to do this on a simple level
without a Hard Drive? Both systems have two DSDD drives. I use
a program to format my diskettes to 912 K. I'll be open to any]
helpful suggestions. I would prefer a PD program.

Thanks,
G. II. L.

If XForm_do() is working on a form with a disabled DEFAULT button, pressing return will activate the button!! This might also happen in form_do()/form_keybd(), I'm not sure.

Other interesting XControl features:
CPXes get set WM_TOPPED messages (well, not *that* interesting!), and also get sent AP_DRAGDROP messages (very interesting/useful!)

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi Roger!

>Bad Points..

>2. No class 1 support, not a big minus if you buy a good modem..

Yes, but the only Modems I know with FCLASS=1 are the US-Robotics Modems.
And the newer ones of the support FCLASS=2.0 and this option works very fine
in COMA 2.10.
That was the reason, why i bought the programm.

Ciao,
Bertl.

1046. A really odd question?

Newsgroup: comp.sys.atari.st
Date: 1994-07-22 14:48:52 UTC
From: rimfax@bu.edu
Message-ID: <30om8k$asb@news.bu.edu>
Source record: 183394

I was wondering, I have a fanciful imagination, if it is possible to connect several ST boards together to make a parrallel processing "like" unit. I had this thought after seeing so many ST's for sale. Would it be feasible? What modifications would have to be made to the OS? Could an OS be made so that each processor assumes a specific task?

To me it sounds impossible, but may'be some more enterprising technical guru could find some use to my outlandish imagination.

At any rate I am very interested in hearing whether or not there could be any merit to the idea, and why it would or wouldn't work. As I am always looking to learn more.

Thanks

Hi Folks,
im looking for a working Fax-receive prog. with ZyXEL modems
and the CoNnect terminal.
I tried various versions of HackFax and junior_office (TKR) with no
satisfying results.
My config is: TT, Zyx.E+ (Modem2), CoNnect2.46

Any hints are highly appreciated.

Stefan.

1048. Info wanted on Window Term, please help

Newsgroup: comp.sys.atari.st
Date: 1994-07-22 17:50:28 UTC
From: raver909@telerama.lm.com
Message-ID: <30p0t4$4rf@epicycle.lm.com>
Source record: 183396

Ok, I found a terminal program on atari.archive called Window Term that lets makes the terminal in a Gem window. I like this program alot except:
1) It doesn't support 2400 BPS modems (or anything above 1200 for that matter).
2) It doesn't support VT-100 codes (just VT-52 which almost no one uses).

Now that said I have V.1.0 of Window Term it was made back in 1987.
Surely there must have been later versions of this.
Are there any versions higher than 1.0? If not, are there any other PD or shareware programs that will run in a Gem window?

From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <94203.141214STIRRE31@MAINE.MAINE.EDU>
Source record: 183398

Well, I recently dowloaded NH off of the umich archive but am
having problems running it on my Falcon.
In 640 x 480 x 16 mode the games slows down the system to a
crawl.
In 640 x 480 x 256 mode the game runs but only allows the character
to be moved in certain ways (ie. he is blocked by darkness).
The area that the character discovers is also revealed strangely
in that the darkness is lit up in dots across the screen not
graudally as I would expect to happen.
Has anyone else had problems like this or should I just try
downloading it again? BTW, I already ran it with no DAs or
AUTO progs.
Thanks,
scott tirrell

Is there someone out there who has managed to start a connection with
Mint Net 0.51 on a Falcon?

I have patched Mint to 1.10h6, and the Net drivers seem to load correctly,
but when i try to start ifconfig i get the message "socket: unknown
protocol" or something.

Is there someone who has it up and working? All help is welcome.

There is some kind of MIDI network software floating around the net.
bute speed of this net would be a major bottleneck. in real parallel
processing machines, you have shared memory and data transfer speeds
close to the normal BUS speed.

> I had this thought after seeing so many
>ST's for sale. Would it be feasible? What modifications would
>have to be made to the OS? Could an OS be made so that each
>processor assumes a specific task?

I would say writing a new OS would be less complicated. It would be like
trying to put rocket boosters on a tricycle to modify TOS like that.
Once they finalize MINTnet and get MIDI drivers on it, I guess they
could get rexec to work (execute code on another machine function).
then again, since it is a MIDI network, no real hardware, it would have to
be handled totally by software, and thus if there was a lot of traffic on
this net, then it would slow down all the computers with all this net
processing.

> To me it sounds impossible, but may'be some more
>enterprising technical guru could find some use to my outlandish

it's like putting rocket bootsters on a tricycle

>
> At any rate I am very interested in hearing whether or
>not there could be any merit to the idea, and why it would or
>wouldn't work. As I am always looking to learn more

cool idea. but, there would be too much overhead to work properly.
maybe long, long cpu-bound jobs would benefit from this, but it wouldn't
make it into a Alpha AXP workstation.

Please answer in email ONLY to jacob@take.oecj.co.jp

(that is NOT to the posting account)

Greetings:

My Atari St has died and I am left with my Creator 1.1. files.
(Creator 1.1. is an old version of an Atari St sequencer)

As you can imagine I am in bad need of some help...

Basically I intend to switch to a PC or a Mac and I don't know which
sequencer I will get. I do not necessarily wanna get Emagic but I might.

So basically I intend to convert my files to MIDI files in PC or Mac format
(it doesn't matter which since I can always convert from one to the other)
and also keep a copy of my original files on PC or Mac formatted floppies
just in case I decide do go with Emagic and Emagic can deal with Creator
files.

0. What would be your way to address this situation?

1. Is it true Atari floppies are formatted like DOS floppies? (This would
mean I can read them with a PC drive, right?)

2. Can Emagic read Creator files?

3. Anybody out there owning Creator (or maybe Emagic, see 2.) who'd
be willing to help?

4. Any other maybe better ideas?

Email answers only please. (Use jacob@take.oecj.co.jp)

Cheers (so to speak),
Jacob

In article <1994Jul21.234221.11782@abo.fi> THIETAVUO@FINABO.ABO.FI
(Tommi Hietavuo TKKK) writes:

>Any chances for Finnish automatic hyphenation..? The rules are very simple,
>so it wouldn't be difficult for you. I know the market is small - but for us,
>who want to use Papyrus in Finnish, that would be great..!

Bad chances, we licensed the pattern-based hyphenation from Oliver Voelckers
and only have the object code for that. I don't think I can persuade
him to build that in.
How well does the German hyphenation work for Finnish? The pronounciation
seems to be the one thing that's straightforward in Finnish :-)

>Can you tell me (or find out) what the English version will be - and about how
>long do we have to wait for it..?

It's shipping next week. I just sent 3.51 to HiSoft. It took rather long to
finish the english manual.

>- The cursor doesn't follow while scrolling the screen with shift-arrow or
> control-arrow. I guess you have already fixed that one..?

That's not a bug, it's a feature :-). These shortcuts are considered equivalent
to slidermovements. Actually this is useful to select several pages of text:
Put the text cursor at the start, leaf forward (with shift-arrow or the
sliders),shift-click.

>- Demo didn't work with Geneva 1.01 (problem with ruler)

I'll get a copy of Geneva next week or so. This will be fixed if it's my fault.

>- Some statistics about how many pages, words, etc would be nice.

This is planned. Guess it will be ready in a month or so.

>- How about CVG support..? (for Calamus users)

I have the docs, I'll take a look how much work it is.

>- Or PostScript support..?

No way. This is definitely too complex, and besides it wouldn't be
WYSIWYG anymore as long as Type 1 faces can't be used.
But maybe Speedo 5 or NVDI 3 will provide a PostScript GDOS driver.

>Well, there's little to complain. It's simply one of the best word processors
>ever - and I hope you'll develop it further. As long as there are programs
>like Papyrus, Calamus SL, Connect and Chagall - there's no need to buy a PC or

> Anybody know where I can get a French dico for it [papyrus]?

As long as we don't yet have one, and if you are really eager you could use a PD word list. try ftping black.ox.ac.uk in directory /wordlists or ask archie first. Of course you would have to get the accented characters right first. papyrus will accept ASCII word lists if they are correctly sorted by Atari ASCII and there are no duplicate words, otherwise you get an error message.

Knowing Mark quite well, I should really say here that he's
just been pushed into situation where he has offloaded all of his
computer equipment, so further development on TeddyTerm seems unlikely
:-(I don't know as yet if he's passing the source (GfA BASIC) to
anyone else to develop either.

1068. Geneva help wanted

Newsgroup: comp.sys.atari.st
Date: 1994-07-23 04:11:28 UTC
From: mattk@netcom.com
Message-ID: <mattkCtDKz4.8M3@netcom.com>
Source record: 183311

Geneva users of the world, untie, er unite!

Just kidding...I just put in Geneva and started to see what would run. So far, I can't seem to get anything i normally use to multitask. I bought it at the same time I bought an ICD Adspeed thinking that with the speed boost that would give, I could have say, an archiver shell and Storm in at the same time. (NOthing I could do to get Strom to work under Geneva--but I've not tried to goof with any of the settings)

To make a long ramble short, I'd like to correspond with Geneva users who have gained a modicom of control over their systems since they put Geneva in. I'd also like to know if Gribnif or ayone else has put together a list of what will and will not run under Geneva--and hinstrunctions to make it so....

The press release says that Mint and Geneva can work together...how? DO you boot up with Mint and Geneva in the auto folder? And what do you do about GEMENV? Geneva won't boot if GEMENV runs first...

Argh! IEarlier today, I was getting upset with Geneva...seems like I bought a program that won't work with anything. Pretty icons and tear off menues...whoopie...

I sure hope someone has battled some of these dragons...it looks like a fine piece of programming, but I"d like to get some use out of it...

Bye for now,
Matt Koundakjian <mattk@netcom.com>

How come there is a still a Atari UK, from the posts here and in AEO there was
only 2 Atari divisions left, one was the Netherlands..

Or were those reports at fault...??

1073. "Reach for the Skies" works on Falcon030?

Newsgroup: comp.sys.atari.st
Date: 1994-07-23 09:11:11 UTC
From: mipap@ars.ath.forthnet.gr
Message-ID: <012122TLWYAFYCWOJIAW@ars.ath.forthnet.gr>
Source record: 183308

IP> I recently got "Reach for the Skies", a flight simulator/game
IP>which was listed as working without problems on the Falcon 030 in
IP>Heikko's (?) list. I haven't been able to get it to work.

I can run it from hard disk without problems. It even resets resolution
to ST Low. Note that the computer is clean. No acc (except Sound reset
), no Auto programs and no NVDI.

IP>Using backward and floppies, or running from hard disk with the bus
IP>set to STE mode (with FalconSX) gets the game to work partially - you
IP>can actually get flying by selecting "pilot" mode and then "intercept",
IP>which puts you in the middle of a dogfight. If you select "takeoff"
IP>from "pilot" mode, after the copy protection check is over, the engine
IP>noise sound starts and the game locks up.

Maybe that's the problem: The copy protection. You see my copy lacks the
copy protection thing. Ah! I must run a program that resets available
memory to 2MB before i run the game.
Maybe running the game inside Backward with caches off and CPU/Blitter
set to 8Mhz fixes the problem? After you pass the protection screen,
reset the values (open caches, CPU/Blitter to 16) with the numeric
pad.

Michael.

Qfax or Straight Fax should both do fine. But i'm not sure if they'll work
on the modem2 port.
When you use Connect, there is a pd program available called BtFAX, this
will let you receive fax from within Connect. You need Qfax or Straight Fax
to view the Fax's.

>stirre31@maine.maine.edu

I have a similar problem with NetHack, in 16 color modes most of the
graphics is ok. But in most 256 color modes with resolutions lower
than 1024 x 768 there is only the character icon and the redraw does
not work. I thought it could be a problem of my graphix card (self
made STGA, ST-VGA adaptor) or my VDI (self made, too). I'm very glad
to hear that other people are having problems, too. Sometimes even
some of the tools icons in dialog boxes are damaged.

Downloading it again will change nothing.

Perhaps someday there will be a new version ...

Ciao,
Till

Depends how it's encoded. The dictinary routines allow ASCII
characters up to 223, that is only mathematical symbols at the
top which include some greek characters are out. If you don't
use these ASCII positions, no problem.

1080. Re: For Sale TOS 2.06

Newsgroup: comp.sys.atari.st
Date: 1994-07-23 18:42:49 UTC
From: JHOOPER@ua1vm.ua.edu
Message-ID: <16FFCC0D9.JHOOPER@ua1vm.ua.edu>
Source record: 183323

I have a TOS extension card for a Mega ST (only) to upgrade it to TOS 2.06. Works well, but I have large set-up on Base 2, which won't work with 2.06. I paid $150 for it; plugs in; full and easy instructions in manual. Gives all the advantages of the new desk-top (like Neodesk & Maxifile). So make me an offer. Also have Convector and Geneva, neither of which I use.

1081. TOS 2.06 upgrade gone awrey

Actually, that's the going rate for a ST hard disk, I know I'm a
dealer! Don't even attempt to compare ST disks to the lowering
Dos supply of IDE disks, no comparison! A ICD host list in Canada
right now is $150!!!! That's just the controller, and the ICD
case w/supply, ICD ADSCSI Plus, ID etc is a whopping $295!!!
No disk!!! There it sorta sums things up! $300 CDN for a good
working Megafile 30!

Hello...

STeve here from STeve's Atari SALES!. To answer you question, there is
no plans to use a Falcon030 as a development platform for the Jaguar. Either
a High-End 486 system or Atari's own TT030 will work (as you already know).
If I can help in anyway, feel free to contact me at once... Take care

1087. Note to Nethack gurus...

Newsgroup: comp.sys.atari.st
Date: 1994-07-23 23:52:45 UTC
From: alrashi@ecf.toronto.edu
Message-ID: <CtF3ny.G8y@ecf.toronto.edu>
Source record: 183330

To all the Nethack gurus out there... I just wanted to bring to their attention that the official nethack site "linc.cis.upenn.edu" does NOT have a copy of the Atari binaries. To the porters (both text and gem form), you might want to notify the archive maintainers as to the status of the Atari hack binaries.

Just wanted to spread the news...

stevedc@ac.dal.ca wrote:
: > Do you really want _that_ $200 US for a 30 MB-harddisk ????
: Actually, that's the going rate for a ST hard disk, I know I'm a
: dealer! Don't even attempt to compare ST disks to the lowering
: Dos supply of IDE disks, no comparison! A ICD host list in Canada
: right now is $150!!!! That's just the controller, and the ICD
: case w/supply, ICD ADSCSI Plus, ID etc is a whopping $295!!!
: No disk!!! There it sorta sums things up! $300 CDN for a good
: working Megafile 30!

(all prices US)
I'm in the market for another hard drive for my Falcon. There is an ad for a 340MB external SCSI hard drive for about $460. That's $1.35/MB vs $6.67/MB for the Megafile 30. There are two other factors: (at least two:)

1) ADSI -> SCSI interface for computers w/o SCSI ports
2) How much memory you can afford

In regard to item two, I can find a 1GB HD for a super low $/MB but that is out of my dollar range. I believe a 30MB hard drive these days is too little, my 84MB internal and 30MB external are even full. I suggest spending some extra money an get a larger HD. The cheapest way out is to buy a used Atari compatible 30MB HD with a damaged disk (working interface, power supply etc.) and install an internal SCSI disk.

Mindscapes GENESIA....!!!

Hi does any one know if GENESIA ever came out for the Atari,
Atari ST-User did a preview of it way back in Feb, and claimed
that it would be out early 1994...??

Does any one know...??

Please e-mail me if they do.....

Thanks....

1091. NEEDED: prg. to change UNIX->ST

Newsgroup: comp.sys.atari.st
Date: 1994-07-24 01:14:02 UTC
From: hallvart@ifi.uio.no
Message-ID: <30sf8q$ai3@dyggve.ifi.uio.no>
Source record: 183329

I need a program or accessory that will convert end-of-lines in text files
from the UNIX standard to MSDOS/Atari ST standards.
I currently use the "UNIX2ST" and "ST2UNIX" '.TTP' programs, but I would more
like a GEM program/accessory to do this instead of having to remember the filenames
correctly and typing them. Any such program around?

Hallvard, Oslo, Norway

1092. ATARI STe System For Sale

I don't give part numbers because (a) I don't have access to the machine
and (b) I didn;t actually do the ordering of the blessed things.

> >had DMA problems and have fitted/changed DMA's in all of them. The best
> >results are obtained in the end with "old" DMA chips, very short DMA
> >leads - like 6" and ICD HA's and s/w.
>
>
> Sorry I don't believe you, and most people could not even use there hard drives
> with 6" leads...

I don't personally care a light whether you believe me or not - I am not
given to fabrication or lies of any shape size or description and am
not about to start now. What I have related here is an accurate and
correct account of what actually happened.

> Also I do think that Atari should know more than you, well they made the
> machines....

Well, I beg to differ there. Atari have a well known and documented
history of screwing things up in various areas over the years. I am NOT
suggesting that I know more than the Atari Corp in general but certainly
in this case, Atari UK could not solve the problem.

The machine actually went to two registered (very well known concerns)
h/w agents and had the original DMA upgrade done. The machine
subsequently would NOT work on it's return and was sent to Atari UK,
where they too meddled with it and also returned it declaring nothing
was wrong with it. Still it failed to work correctly with the HD on it's
return. It was at this point that we started changing DMA chips
ourselves (Atari actually supplied the first one at 10 UK pounds and the
subsequent ones free of charge).

I am not prepared to name the companies concerned publicly (because they
were not to blame) but if you'd like to mail me Roger, I will give a
fuller account of what happened and should you wish, you may then trace
the machine back through it's history to verify it all.

Suffice to say, that a scope and logic analyser, showed better drive/timing characteristics with the old DMA chip (CO25913-38) out of my Mega (not STe) than the newer ones supplied.

> As I say chaps Please look before you leep....

Yes, my sentiments too. I have incedentally given this advice to a couple of others and one of whom I know had no further trouble after fitting an "old" DMA chip.

Cheers, Martin.

1094. Re: Atari Compendium Book

Newsgroup: comp.sys.atari.st
Date: 1994-07-24 02:10:38 UTC
From: scotty@cais2.cais.com
Message-ID: <30siiu$16n@sun.cais.com>
Source record: 183332

I have a problem with the upgrade offer on the Compendium. Granted, it is an excellent product, and something that might have greatly improved things for the Atari Community if it had been widely available six years ago.

Anyway, I shelled out $50 for this book back in March. Based on their upgrade policy, I can send in the cover of the book and save $5 to get the new book.

This leaves me with one hardly used coverless book I don't need, and one brand new book. On the other hand, the card I mailed in said that I would receive addenda as they became available. There have been none -- but as a long time Atarian, I've lived with worse...

<WHINE ON>

So why couldn't they have offered me the 90 new pages as an addenda, for another five bucks?

Buying a whole new book to get them is expensive for me and wasteful to boot!

From: krlawson@freenet.hut.fi
Message-ID: <30sjs0$t90@freenet.hut.fi>
Source record: 183334

I was nicely playing a good game called starball, and I had about
50000000 on my score board, and about 10000000 bonus. The sun was shining
and life seemed nice. Then.... it happened... the ball went up yet again
into a bonus level but funnily, the bonus level didn't load.. the screen
went blank, and almost immediately 2 bombs and the cute bee appeared on
screen. Then it hit me.. the game was over, and all because of some
bug somewhere.. that almost killed me. Staring at the screen, just a little
annoyed, I sweared to myself, and took a walk around the room. This was the
best game I had ever played, and it was a new highscore, but it ended so
abruptly. I quietly sweared to myself, while my friend was almost laughing
beside me. 'This can't be true!'...
Now I have made myself a promise: 'I will not play this game ever again in
my life till I get a version with a bomb disposal unit supplied.'
I hope I will not have to wait too long...

Great stuff, Vroom! the later edition ("Vroom Multiplayer") is just
about the same, but with the addition of a heavily insane Turbo Mode :-)
try playing /that/ at 16MHz with mouse control <grin>

> No Second Prize - motorcycle racing, 3-D solid polygon graphics, have seen
> one good review.

Again, I like it. The mouse control of the bike is really good, and
it takes practice to get /anywhere/ :-)

> Can anyone comment on the above? I don't want to buy all of them and end
> up with two that suck. Any known bugs? Works with TOS 2.06? Works at
> 16mHz? Null modem head-to-head capability? Thanks in advance for any
> comments.

I know Vroom runs fine at 16MHz (it screams along) on TOS2.06, and
the original had a null-modem link. Not sure if NSP runs at 16/TOS2,
I'll get it checked for you later this week if I can.
Try playing Vroom before you part with any $$$, and see if you
suffer from the usual syndrome - you get really involved, your head ends
up closer and closer to the monitor, and when you crash you don't half
jump ;->

However, the Megafile 30 is an RLL mechanism utilizing a 65MS Segate ST-238R drive. Hardly up-to-date technology. I cannibalized my old Megafile 30 (which I bought for $200 CDN) to make myself a 250 meg setup, which only costed me $330 extra.

And incidentally, you can get host adapters cheaper than $150.

I've cross-posted this as it may interest some of you, it was originally
from a BBS system in England.

+++++++

Hi! This is just a quick (hopefully!) message to all
those Star Trek fans (aka "Trekkies") out there....

"NOVA" is a new Atari ST disk magazine which is
non-profit making and is for all genres of Trekkies.
Issue one has already been released and hopefuly
either some of the files or the complete disk
will be uploaded to this BBS soon.

Issue 2 is out now and can be obtained by
sending a blank disk, one pound (made
payable to "James Bird") and a SAE to:

NOVA
91 Elm tree Avenue
Kilburn
Belper
Derby
DE56 0NN
England.

And don't forget to mention where you found out
about it from!!....

I hate to tell you this, but I have a new Toad Computers catalog with me and everything you're asking $275 for (Lynx, AC adapter, Comlynx, case and games) could be had through them for just $245 + shipping... and that's for a brand-new Lynx II.

If you haven't heard, the Lynx II is available for $59, and most old-release games are now available for $19.99 (though a few sell for $29.99 and some new releases are going for nearly $50.00).

You might want to re-think your price on that set-up....

From: mparrott@connected.com
Message-ID: <30t952$dfp@hebron.connected.com>
Source record: 183339

I also use a BJC-600 with PageStream. Thus far, there is no BJC-600-specific driver for PgS 2.2; talks with Soft Logik don't leave me with the impression that they're humping on the project, either. Perhaps with the demise of C=, they might take another long, hard look at their loyal Atari customers, but I wouldn't count on it.

As for page sizing, instead of printing at a reduced percentage, try setting your page size, in both the Page Dimensions dialog and the Configure Printer dialog, to 8" x 10.12" (or just 10" if you like even integers). This is (roughly) the actual printing area of the BJC-600, and most items will come out more properly centered/ positioned when printing at 100% with the setting for reduced page size.

If you come up with a way to lighten up color bitmaps when printing from PgS 2.2, please let me know. For know, the only way I've come up with is to brighten the bitmap in another package and re-import into PgS and try again until it comes out right... most color bitmap images tend to come out too dark and use too much ink with the LQ2550C.PRT driver unless externally brightened....

Excuse me? There is quite some documentation in the package imo, although it indeed is all in German. The new version has even some stuff on the new Mupfel (something that was lacking in the previous release unfortunately).

And then, even without any docs at all, I think installing and using Gemini is quite straightforward. Sure, all the deep ins and outs of the Mupfel shell is a whole other piece of cake, but getting a functioning setup isn't that hard. And if you know Unix a bit, and stuff like shell-scripts, it's even easier, since Mupfel resembles those quite a lot.

The only changes I made to the default setup is renaming the 'user' directory to 'usr', and merging the MAN1, CAT1 and CAT1M directories into one big MAN1 directory, since I use a real manpager which expects all manpages to be in the MANx directories... And that's it. Additionally pick up copies of awk, sed, perl, nroff, man, mkproto, and all Julian's tools (mupfeltools and texttools), and perhaps a few more, and you have an unbeatable setup... I really wished there was something like the Gemini/Mupfel pair for my Mac...

: I am connecting remotely to our university's dial-up faciltiy. I have Uni-
: term 2.0, which has the Kermit(which I think is how you FTP), X-modem, and
: Y-modem protcals. I know how to type in everything right(I think), but I
: Do not know why I cannot transfer stuff to MY disks. Can anyone help me?

: If you wish to respond by E-mail, mention "For Wade Lahoda" in the title,
: As i am using a muliti-user account. Thanks in advance!!! HELP!

First of all, your ftp'd file will be sent to your home directory which
should come under the heading of Mail. There are a few simple instructions
you only have to use to ftp. Follow these instructions and you cant go
wrong!!!! After you have found the file that you want to ftp,
(1) Type the word " binary "
(2) Type the word " prompt" (I will explain this later)
(3) Type the word " mget " and the name of the file EXACTLY as it is written
(the file will now d/l to your Mail directory at your site)

(4) Type the words "ls -a" to see the files in your Mail dir
(5) Type the word "uncompress" as the files will be compressed and your
server will uncompress them for you.

(6)Type the words "sz " and the name of the file as it is written exactly
in your Mail Dir after decompressing. (the z in sz stands for z modem
if you are using another file transfer protocol then you had better
find out what to put instead of z 8-)).

(7) The files will now be downloaded to your machine. I would say that you
are thinking that the files should be downloading to you like they would
when you d/l from a normal BBS, but, you must remember that this is like
downloading from one bbs (the ftp site) to another bbs (your server)

Now what the word "prompt" means is, that the ftp site that is sending files
to you wont ask you for confirmation for each file that you want. It dosntg
really matter if it is just one file you want, but if you want 20 files
in one go then it becomes a pain in the youknowwhat. BTW, you can also
type the word "hash" so that you can see how much of the program is
being downloaded.

I hope you can make sense of this, it is quite easy once you get used to it
...... John Moon s9205525@otto.bf.rmit.edu.au

I would state that COMA 220 leaves all otheres for dead, has Full support
for ZyXELs plus voice and you can try it out as its on mosts sites as
Cripleware, but that just limits it to sending 500 lines..

Has many other features like FTP support and from what I know can be driven
as a command line program..

P.S. There are no demos of Straight Fax 2.1 and from what I have been reading
its no longer being supported, as the Author found a hacked copy on a USA BBS,
and saw no point in supporting Atari any more, but that could have changed by
now...

The database program DBMaster One is available as shareware on many vendors
catalog. It is ancient but has a nice graphical design feature, small,
and will fit the bill. I'm not sure if its on FTP though...

It used to be a commercial program and is the predesessor of ANTIC's Base II
database program...

I attended the MIST show in Indianapolis and spoke with Dan while ordering
my upgrade. I think they had been hopeful of having the upgrade ready
for the show also- but it didn't quite make it. Dan told me that they
expect to be shipping the upgrades out around August 1st.

See my later article on the show. It was very encouraging - at least
to me since I still use my Atari Computers! We still have quite a few
software vendors supporting us with upgrades to our software and new
software. Wayne

> Matt Koundakjian <mattk@netcom.com>

Always hard to answer letters like this...

Let me see. First of all, what programs didn't work (other than STorm, which I've never used myself, but I believe I've heard works fine with the single-tasking flag)?

Second, I don't know if you've read the READ.ME file or not, but MiNT support is not 100% complete yet. There were some bugs in MiNT that prohibited us from putting the support in (this is almost a year ago, when we were getting Geneva out the door). These issues have not been resolved, and as soon as we get NeoDesk 4 out the door (1 week or so) we will sit down and get the MiNT support ironed out.

Third, you might be best off to give us a call at our technical support line. It sounds like you might have a weird installation that might be affecting your system performance. Just about everything works in Geneva. The biggest problems are in games and midi programs.

I just stuck two fairly new demos on atari.archive.umich.edu.

techno.zip - Techno Drugs, excellent STE/Falcon color demo, similar to the Omega demo, which is my all time favorite STE demo. Lots of rotoscoping, good MOD soundtrack, etc. Really needs a hard drive, but there may be a way to run it from floppies. Very impressive, runs like a music video.

whdbr_[ab].msa - When Hifidelity Dreams Become Reality, lots of good MODs playing at 50kHz stereo. STE/Falcon color.

Also, I stuck a working copy of State of the Art, and cleverly managed to delete State of the Art II in the process :-). If someone could email me or upload this demo to atari.archive.umich.edu, I would appreciate it.

Is it not the case that the first Lynx is superior to the second? I have
been toying with the idea of buying one for my significant other, as she has
developed an interest in Chip's Challenge. I was under the impression that
the first Lynx was better, but much more expensive to make.

1121. Indianapolis Show Report

Newsgroup: comp.sys.atari.st
Date: 1994-07-24 17:14:05 UTC
From: trek@intgp4.ih.att.com
Message-ID: <CtGFvH.LtI@nntpa.cb.att.com>
Source record: 183263

My son and I just got back from the Indianapolis show. It was very encouraging to me, an Atari owner and for vendors and dealers. The vendors and dealers were generally pretty happy with sales from the opening doors and the people that showed up throughout the show. I didn't hear a final count of attendance but it was up significantly from last year.

From a user's perspective it was really encouraging to still see familiar faces and vendor names supporting the Atari line of computers with software upgrades and some new releases. I was surprised as I stood in line and I looked over the others standing in line - ages really ranged from the fairly young, to the teens, to the young adults, to us middle-agers, to the older generation. I had never quite noticed such an age spread before.

A quick run down of the vendors (apologies to any I miss - and especially to the other helpers in the booths that I did not talk with nor mention below) This is from memory - so I hope I didn't miss too much.

Dorothy Brumleve was there with her line of software for our younger-at-heart users. If you are needing educational software or software to enhance your young son or daughters experiences with a computer, you definitely should contact Dorothy. (Kidpainter, Multiplay, Kidpublisher Professional, Super Kidgrid, and MathArt) Really outstanding products. Sure wish Jonathan was either born later or Dorothy had gotten her start sooner.

Clear Thinking was there with an update for Edhak - sorry, Edit Plus v 3.1 - as the program is now known. (It can be renamed back to Edhak if you need to for QuickCIS.) It has added sorting and encrypting modules and half a dozen new editing features. This program just keeps getting better and better.

Dan of Gribnif was there offering upgrades to Neodesk 4 (taking orders - for ship about 1 August), Gena (immediate delivery) Steno and Stalker (both of which haven't changed yet since the KC show last year), Convector, Arabesque Professional and maybe some other product of theirs that I missed. Both upgrade pricing and show pricing were available.

Missionware was there offering upgrades and purchases of their products like Flash II, all of Hutch's fine programs like Cryptographer, Crossword Creator II, Cyberdrome).

Skyware was there with Seurat, Color Scan (a new beta version for the Falcon which will be completed in the near future- registered users will get a mailing notifying them of its availability when its ready) and Color IMGs (a viewing program) I thought I had forgotten to take my disks with for Skyware since they weren't on the vendors list posted last week. They gave me the beta copy of Color scan to try out on my Falcon anyway. Later in the day while digging through my disk boxes I did run across my Skyware disks. Great to have the update anyway since I have moved to a Falcon.

Toad was also there with their latest catalog and lots of products for your Atari's. This is one vendor you all should know.

A vendor (apologies for not remembering who they were) was there that was carrying among a myriad of other 8 and 16 bit software and magazines, the line of Majicsoft software, including their newest game - Nertz - a type of solitaire that you play with one to nine users (max of two per computer - computers connected via midi or modem or null-modem) It also supports adjustable computer players if you want some competition. This one kept my son and I occupied a bit while we were there. Great fun. They also carried Awarz, Buttonwari, and MAGE, the Majic Arcade Graphics Engine - game generation software. This game was addicting and my son and I will be enjoying many hours of challenging fun, I am sure.

Mark from Mars Merchandising was there with his usual fine selection of games and magazines for the 8 bit, ST/Falcon line, Lynx and Jags. Any of you from the Chicago area surely know them from their store in Villa Park. They really stay on top of the gaming area and are predicting a very bright future for the Jag. Mars also had the JagDapter available for connecting your jag to s-video, RGB monitors, separate chroma/luma, SC1224 and left and right audio feeds. Available now.

ICD was next with their line of hardisk adapters, complete drives, ICD harddisk software, and The Link II. Upgrades were of course, being offered - and Tom was there to discuss any technical issues you wanted to talk about. ICD also had flyers and a demo unit of their CatBox.

Randy Kopchak was there from It's All Relative. He had the full line of CD ROM software, many CD Roms available, Genealogy and weather forcasting software. His software is now able to handle Photo CDs and Audio CDs too. ExtenDos is the defacto standard for handling CD-ROM drives on the Atari. Randy also had the German CD Rom disks for sale.

Systems for Tomorrow, another vendor of fine Atari products was there with tables filled with delights for the ST/Falcon line. I always drop a bundle at their tables. They also had the Motorola-Inside t-shirts (the only intelligent choice) for sale.

Binary Sounds was there (I think I got the name right.) They were offering midi and music software.

Lexicor had a video set up running demos of their software. The booth was crowded so I passed it by, meaning to get back to it but never did :^(.

There were many, many tables set up by user groups at the show. They were selling their club PD disks and all sorts of used software, used hardware - one SST and many fine monitors and harddisk systems, used books and used magazines. I completed some of my library - that's one way to avoid those high shipping charges on used magazines.

Many vendors donated great door prizes for the hourly drawings. My son and I both thank them again for the nice door prizes we won (Pianistics - a keyboard trainer/tutor and Edit Track 7.1 Platinum, and a Motorola Inside t-shirt. You can bet I will wear that one out.)

Looking forward to the next time us Atari Users can get together again - and thanks to the MIST organizers for pulling off the show. My hats off to you on a well run show - may there be many more in your future!

1125. Civilisation Bugs: a fix of sorts

Newsgroup: comp.sys.atari.st
Date: 1994-07-24 17:38:04 UTC
From: Colin.Campbell@mettav.exnet.com
Message-ID: <775067916.0@mettav.exnet>
Source record: 183262

I just discovered how to avoid Civilisation bombing out on me when the powergraph is shown after a win (or if you quit the game). Simply run NVDI! Yep, NVDI causes a bit of screen corruption with this game, but it's not too bad and it stops the game bombing out.

Hurrah! Now I can play it again and not have to worry about having no proof of my exploits... :)

Source record: 183266

>JA> >What's the current progress status of Neodesk 4?
I attended the MIST show in Indianapolis and spoke with Dan while ordering my upgrade. I think they had been hopeful of having the upgrade ready for the show also- but it didn't quite make it. Dan told me that they expect to be shipping the upgrades out around August 1st.

Somewhat frustrating. Getting a Neo4 upgrade was one of the primary reasons I was considering going to Indy. However, I could not make it and I guess it was just as well.

Neo4 may suffer sales by being so late to market. I remember seeing a Codehead note on GEnie about the poor sales of Midi Spy. I greatly respect Gribnif and the Codeheads, but Midi Spy may have missed a market window and Neo4 may be in danger now.

I remember MIST 3 years ago and I was standing in front of the Codehead table with money in hand after reading MidiSpy ads for some months in the mags. It was not ready and I walked away with my money. MidiSpy did not come out for a substantial amount of time after that. I may or may not pick it up one of these days. The same would have happened with Neo4 this year, had I made it.

To developers: do not let "creeping featurism" cause delivery schedules to slip. I am now undecided about the Neo4 upgrade.

1127. CAIN Atari Fun Fest 94 (includes computers!)

```
CAIN Atari Fun Fest 94
----------------------

CLEVELAND, OHIO is within 500 miles of half the population in the United States
and a very LARGE population of Canada. It is a great place for an Atari Show
because most people aren't too far away!

The CAIN Atari Fun Fest 94 will be held in Kirtland, Ohio (very close to
Cleveland) and will allow Lynx and Jaguar owners to have a lot of fun!
There will even be a "Cleveland Lynx-Up" where Lynx owners can bring their
Lynx and game cards and comlynx with other players! Who says that you'll never
get the opportunity to comlynx???

Jaguars will be there to play and you might be lucky enough to take one
home with you (courtesy of Atari Corporation).

There will also be dealerships attending this show that will be more than
happy go give you great deals on game systems and game cartridges!

If you are an Atari computer gaming fanatic, not to worry! There will dealers
there to supply you with all your computer gaming needs...

Dealers:

If you are interested in selling your Atari merchandise, this is a fantastic
opportunity for you to do so! But you must register now! The tables are
being sold quickly! Contact the show organizers immediately!

User Groups:

Several tables have been set aside for user groups! If you are interested
in representing your user group, contact the show organizers! Since
user group tables are FREE, the user group tables are going quick so don't
delay or there may not be any tables left!

PLEASE distribute this on BBSs, networks, and at your user group meetings!
We want to have one heck of a gaming day! And a gaming day that might be
closer to you than you think!

CAIN Atari Fun Fest 94

Category 4, Topic 24
Message 86 Tue Jul 12, 1994
C.S.SMETON [NewSTar Tech] at 22:46 EDT

A message from NewSTar Technology Management and Toad Computers:

STraight FAX Users: ------------------

As many of you know, there has been a significant problem with piracy of
STraight FAX! as of late (June / July 1994). This is a relatively recent
development and has caused us to reevaluate our upgrade policies and
procedures.

For the present time, we will not distribute ANY upgrades electronically --
either on GEnie or on the Toad BBS, and we are post-poning the release of
version 2.20 (the functional code for which is entirely finished) until
we can implement a new copy protection / registration strategy. We may begin
electronic distribution of upgrades again at a later time. Watch here for
further developments.

We will not tolerate piracy of the product. For us to continue to
support the product, any illegal distribution must be stopped.
Furthermore, we will be strictly enforcing our policy of giving technical
support only to registered users. If you are seeking techincal support,
please be sure to have your registration number handy.

To Upgrade To Version 2.20 (when available):

From Version 1: Send $30 plus your master disk to
Toad Computers, along with $3 S&H.

From Version 2: Please send $5 + $3 S&H to
Toad Computers.

If you have any questions about the upgrade path or policies, please leave
GEMail to TOAD or call Toad Computers at (410) 544-6943.

Thank You

If you want to replace the internal Falcon IDE drive I believe it must be
a 2.5 inch unit. The most popular IDE drives are 3.5 inch and I don't
think they will fit. That's a good question, maybe someone else replaced
their internal drive...

The GEM version is not yet part of the official set of ports, so linc
is not the place for this version. The reason is that it is C++ and
uses my entire GEM++ class library. As the Atari platform is very
small, it's unrealistic to expect the 400K of code that is for GEM
NetHack to be kept with the official sources. Nevertheless, I'm fully
following along with the DevTeam, so to the end-user, there is no loss.

The TOS version is usually compiled by Eric Smith... and I guess he's
a very busy fellow these days.

I've tried tracking this down, but I simply cannot repeat it on my TT.
All I can suggest is to run it under MultiTOS, as that way you're running
the same operating system as me, rather than the Falcon TOS.

>Perhaps someday there will be a new version ...

I have continued work on GEM NetHackm but I am working with the NH DevTeam,
so I am keeping up-to-date with the NEXT version that they release. This
means that I cannot release my own version. As soon as the DevTeams release
another version, I will release a new GEM version. There are many new
features in the current DevTeam version, but obviously, I'm not at liberty
to reveal them. All I can reveal are the additions I've made to MY version,
aside from the official ones. They are: Colour minimap and Macros. I've
also added code to support many of the new ideas from the DevTeam.

BTW, some have reported that an earlier version was more successful.

This is always a very complex issue to address. When designing a program for upgrade we try to set forth a clear list of new features and capabilities. In the past this has allowed us to deliver reasonably close to our original estimates.

However, this time things were a little different, and let me try to explain why. First of all, the Atari market is in a decline. Second, it became clear to us that to get a reasonable number of users to upgrade we could not just do a "couple" of changes to NeoDesk, we needed to put a substancial amount of work into it. Third, there were literally dozens of ideas that we had been dying to put into the program that we were just plain old tired of waiting for a chance to put in.

Therefore, halfway through the development cycle we made the decision to add a larger series of features than originally planned. These included Program Groups, SpeedoGDOS support (everywhere), Geneva-style features (without requiring Geneva, these are built-in), Geneva style hypertext online help, Windows icon format support, Dual Icons (different icon when selected than the icon used when unselected), and background disk/file operations.

We felt that it was better to add six months to the release date, than to have our users go on without these features.

The good news, is that we are done. Right now all that is left is for me to finish the index to the manual, get it to the printer, and we ship.

Since it only takes the printer 3-4 days to deliver, I figure we will be shipping by mid next week. Again, I'm very sorry for the delay, but I think that in the end you will be very happy with the results.

NeoDesk 4 incorporates many new features and capabilities which are not only new to the Atari, but unique among most other operating system. It is a great showpiece of how powerful the Atari is and how much fun it is to use (I'll stop now, as I hate sounding like an ad, especially over the internet ;-).

We are very committed to supporting the Atari and seriously plan to continue supporting it for years to come.

From: ac382@FreeNet.Carleton.CA
Message-ID: <CtH6s5.1Iz@freenet.carleton.ca>
Source record: 183296

Hi I was hoping someone here might be able to help me out with my problem.
A fellow Falcon owner (who doesn't have access to usenet) has just
purchased a 1.08 Gigabyte SCSI II drive to use for d2d recording.
It is a Dynatek (actual drive mechanism is Quantum I think) HDA1.0 QSDM1.
The drive ID is set to 0, but the Falcon does not recognize the drive.
He is using a 4MB RAM, 80MB IDE Falcon with the Atari HD driver (6.61)

I seem to remember a few other people having similar problems but I can't
recall what the solution was.

Thanks

Message-ID: <30va3j$v7@agate.berkeley.edu>
Source record: 183282
Cross-posted to: comp.sys.atari.st,misc.forsale.computers.other

Hello there. I have a complete Atari Mega ST system with software and accessories to sell. All prices are negotiable and all offers will be considered. I'll sell to either: the first person to offer my asking price, OR the best reasonable offer after 1 week, OR the best "unreasonable" offer after 2 weeks (i.e. Everything needs to go :)). Note that my asking prices don't include shipping if necessary (I am in the San Francisco Bay area). If you buy enough hardware, I'll give you the software pretty cheap. If you are at all interested in anything or if you have any questions, please contact me by email or phone and we'll talk (My email addresses and phone number are at the end of this message).
Following is the list of stuff. Thanks for reading!

<< HARDWARE >>

Mega ST: 4 Mb RAM, TOS 1.4, Overscan video expander installed, supports 1.4 Mb (i.e High Density) floppy drives. Excellent condition with keyboard, mouse and mousepad, joystick, and original box and manuals. It can also include the tweety board and AT-Speed listed below (they are currently installed).
$300

Tweety Board: Provides 3-channel "stereo" sound on all ST computers.
$10

AT-Speed C16: Hardware-based IBM PC emulator, has 16 MHz 80286 processor and 80287 math coprocessor, mounts directly on CPU of 520/1040/Mega ST. With appropriate adaptor, it can also fit in the Mega expansion slot or an STE. Runs as a program or a desk accessory. Supports many video modes, including 16 color CGA, and monochrome EGA and VGA. Even runs Windows 3.1.
$150

Spectre GCR: Macintosh emulator for all ST/STE's and TT. Includes genuine Apple 128k ROMs, Spectre 3.0 software, Mac System 6.0.5, a Macintosh reference manual, and Epstart printer driver which allows printing on Epson-compatible dot matrix printers.
$200

Atari SM124 monochrome monitor: Very sharp picture.
$65

Atari SC1224 color monitor: This is the nice JVC-built one with the controls on the front.
$100

Monitor Master switchbox: Allows both monitors to be connected simultaneously, switch between them by pushing a button.

$15

External Hard Disk/Floppy Disk system: Contains a Maxtor LXT-200s 200 Mb 3.5" SCSI hard disk, ICD AdSCSI controller, and a TEAC 3.5" 1.4 Mb floppy drive (which can still use 720k and 360k disks). These are all mounted in a nice looking, sturdy, shoebox-style case with power supply and a good-size fan. This is a nice unit, quiet and fast!
$300

TOS 1.2: 2-chip set.
$10

Turbo Blitz cable and software: If you have 2 floppy drives, this allows you to backup copy-protected disks (or any other disks). It works VERY fast because it writes the backup disk at the same time that it is reading the source disk.
$10

A-B switchbox for modems or printers. It has female DB-25 connectors, good quality construction in a nice metal box. I also have a cable with male DB-25 connectors at both ends if you need it.
$10 (switchbox), $13 (switchbox and cable)

Epson EX-800 dot matrix printer with color kit: Can print black and white or color. It is fast: 300 cps draft, 50 cps Near Letter Quality (NLQ), and bi-directional printing for everything including graphics and NLQ. Has both serial and parallel interfaces. Has an expansion slot for adding other interfaces, larger print buffers, etc. Low usage since new print head was installed. Includes manual, several black ribbons and a color ribbon. Can also include a parallel cable, a stand, and paper if desired.
$100

Hayes SmartModem 2400: Hayes quality, reliability, and sturdiness. No documentation, unfortunately, but it's in great shape and never any problems. Can include cable if needed.
$35, cable $3

<< SOFTWARE >>
(Note: A * by the name indicates that I don't have any printed documentation. A few of those have some documentation on the disks. The list format is: Title, Version (if any), Vendor, Price: Description)

Productivity:

DynaCADD, 1.4, Ditek International, $70: Professional-quality 2D/3D CAD program. 640x400 minimum monitor resolution, 1 Mb minimum RAM, supports math coprocessor, can work with AutoCAD files, fully registered and upgradeable.
Word Writer ST, 2.0, Timeworks, $10: Word processor.
Publishing Partner, Soft Logic, $15: Desktop publishing software. Mono and color versions. Includes extra fonts.
*MichTron BBS, 1.8, MichTron, $5: Electronic bulitten board host software
Financial Cookbook, Electronic Arts, $3: Financial planning.

HabaCom, 1.06, Haba, $3: Telecommunications, terminal emulator.
*Flash, 1.6, Antic, $5: Telecommunications, terminal emulator.
*Kermit & Remote Control accessory for Flash, Antic, $3: Adds the kermit file transfer protocol and remote access capabilities to Flash.
STalker/STeno, 2.06/1.04, Strata, $10: Terminal emulator and text editor respectively. They work together and can also be used separately.
*Degas Elite, 1.1, Batteries Included, $5: Painting, drawing.
Easy Draw, 2.26, Migraph, $20: Nice Vector-based (object oriented) graphics drawing with page-layout capabilities.
Supercharger, 1.02, Migraph, $5: Allows bit-mapped images to be imported and edited/manipulated for use with Easy Draw.

Programming:

*BASIC, Atari, $3: The BASIC that was distributed with some ST's.
DevPac ST, 0.91, Hisoft, $3: 68000 assembler.
Personal Pascal, 1.11, Optimized Systems, $10: Integrated Pascal development environment and compiler.

Utilities:

PC-Ditto, 3.01, Avant Garde, $20: Allows the ST to emulate an IBM PC. Slow, but works well. Runs on all 68000-based ST/STEs. Includes MS-DOS 3.3.
NeoDesk 3, 3.01, Gribnif, $15: Provides a greatly ehnanced desktop with many extra features and capabilities.
Cleanup ST, 4.18, ICD, $10: Hard disk data repair and recovery utilities.
Diamond Back II, 2.42, Oregon Research, $15: Excellent hard disk backup utility.
*Encrypt, 2.0, Stone Age, $5: File and data encryption. Documentation on disk.
*Supra Hard Disk Utilities, 4.04, Supra, $2: Formatting, partitioning, etc. Usually supplied with Supra hard drives.
*Calendar, 1.0, MichTron, $4: Appointment and reminder calendar accessory.
Micro C-Shell, 2.61, Beckmeyer, $5: Unix-like command shell.

Games:

Death Sword, Epyx, $5.
*Arctic Fox, Electronic Arts, $5.
*Dungeon Master, FTL, $5.
Star Trek: The Rebel Universe, Simon & Schuster, $8.
*ST Protector, Paradox, $4.
*World Games, Epyx, $5.
The Pawn, Rainbird, $5.
*Transylvania, Polarware, $4.
*BattleZone, Atari, $5.
*GoldRunner, MicroDeal, $5.

<< MISCELANEOUS free stuff >>

Public Domain and Shareware software: Free with computer or hard disk.
Magazines, catalogs, and other Atari-related info: Free if you want it.
Tilt/swivel monitor stand: Free with one of the monitors.

: I will admit, EA made a brilliant job of Dpaint ST - Much better than
: the Amiga or PC version. (Just a little buggy ,s'all).
:
: --
Good program, but they're hopeless in supporting it. I sent
my registration card away; and later when I had a problem with parts
of the program I tried to get in contact with them and their Australian
distributor, I didn't get any reply whatsoever. As a result, I'm in
a bit of bad mood with EA(and that's saying it nicely).
If they can't even help someone who forked out the dosh for
one of their programs, what good are they?

Hamo

P.S. DPaint ST was written by Artistech Developments, a bunch of
guys who were staunch Atari supporters, not by EA.

Somewhere I read that the latest TOS version upgrade for an STE is TOS 2.05 not TOS 2.06. TOS 2.06 is for the regular ST's(NOT STe). Maybe something got messed up? I have an STE, TOS 1.62 still.

L8rs,

Alberto

>They have a BJC 800 driver that I have mailed to Mickey to place on A.A.
>for me...

I believe the BJC800 driver only works in black and white and not in color. I went through this all on GEnie with Soft Logik when I first got my BJC600 and didn't get much help except to use the LQ2550C driver. Thanks, Mike for the tip on the Page Dimensions.

> having problems running it on my Falcon.

Hallo Steve,

The system I have is tos 4.4, with warp 9 and speedo, sam and the control
panel, and outline fonts. Pretty basic.

I have version 3.1 (as far as I can tell) and it runs perfect in
256 hi res.

I've an svga monitor also.

Sorry I can't help ya more than that, but at least you know it should run.

1149. Re: Atari Compendium Book

Newsgroup: comp.sys.atari.st
Date: 1994-07-25 06:57:05 UTC

Message-ID: <CtHHz5.9uC@nntpa.cb.att.com>
Source record: 183287

Scott Chilcote (scotty@cais2.cais.com) wrote:

: I have a problem with the upgrade offer on the Compendium. Granted, it is an
: excellent product, and something that might have greatly improved things for
: the Atari Community if it had been widely available six years ago.

: Anyway, I shelled out $50 for this book back in March. Based on their upgrade
: policy, I can send in the cover of the book and save $5 to get the new book.

I bought my copy in November last year. For me its value still far
exceeds that $ 5. The 'save $ 5' means 'throw away $ 45' which I don't
like doing.

: This leaves me with one hardly used coverless book I don't need, and one brand
: new book. On the other hand, the card I mailed in said that I would receive
: addenda as they became available. There have been none -- but as a long time
: Atarian, I've lived with worse...

Who did ever get the errata? I didn't!

: <WHINE ON>

: So why couldn't they have offered me the 90 new pages as an addenda, for
: another five bucks?

I would be willing to spend a little more, but not what they are asking.

: Buying a whole new book to get them is expensive for me and wasteful to boot!

: <WHINE OFF>

|> --
```

How about a version that MIGHT have it fixed? Basically I haven't been able to dupliceate this problem in testing despite five hours of constant play checking it every 30 seconds or so.... This makes this sort of bug understandably difficult to fix.

Now I have fixed a small bug which could (but I doubt it) theoretically cause a memory trample, but whether or not this will solve the main problem I don't know....

I guess from the above text that Papyrus doesn't use the 16-bit character encodings in Speedo fonts, which means we won't be able to type 'proper' quote marks, en- and em-dashes and so on. Is there any chance of Papyrus doing this in the future, Christian?

>May be the Author should come on here and talk about it...?

I've found this program too, but I have got problems with the right
configuration. The author of ZZComPro has no mail-adress, it seems so.
Perhaps you can try the french atari group called fr.comp.sys.atari,
but it is empty in the moment.

There are still people at Atari in the UK although I beleive the notepaper has changed to Atari Europe or somesuch. There are still quite a few people there AFAIK - 6 or more including Bob Gleadow, Alistair Bodin (Dev Support), Daryl Still and some others.

Hmm the docs to my topline modem say that it is both Class 1 and 2. I'm
not sure what to think of that. Anyway, I have a question about Coma.
I've tried the Coma 1.40 demo and it is quite nice. It should be
compatible to QFax Pro and since QFax Pro from what I heard is no longer
being developed Coma seems like a good alternative (though I'll also
look at Straight Fax, and Teleoffica Fax or something like that) but if
one does not own QFax, where could one get the drivers needed for e.g.
Speedo or some wordprocessor.

Yeah, I know - they also went on to write Brilliance on the Amiga -
much better than DPaint, and felt incredibly like DPaint ST (Except
it had all the options that DPaint ST and Amiga should have had.

Subject says it all really - is there a document that describes how the game is played? Something of the form "To get X, shoot hole Y, then hit target Z". I have a vague idea what's going on, but haven't quite figured it out totally (which is odd as I usually pick up on pinball tactics quite quickly).

Any help would be appreciated.

BTW - Has anyone got Starball to run under Gemini? I get the first screen and then a message "Unrecoverable file error" when it tries to load the game. If I quit Gemini I don't have this problem. Any ideas? I've an old STFM running TOS 1.02 with 4meg.

Be seeing you,

Coma has a built in Text editor, so there should be no need for a use of a
wordprocessor....

Also COMA 220 has the FTP option, yes you can now get files and faxes from a
remote site, plus it support voice, none of those other programs come any were
near it.....

So get the Coma 220 demo and find out about all these new things...

If you mean Neodesk, I thought every ST user had it? It's almost as much of a must-have as NVDI, especially on older machines.
Currently at V3 with V4 any day now (say Compo UK who distribute Neodesk over here).

I'd say you either forgot to connect something, or managed to accidentally disconnect a wire someplace. But not being an expert, I don't really know.

>Somewhere I read that the latest TOS version upgrade for an STE is TOS
>2.05 not TOS 2.06. TOS 2.06 is for the regular ST's(NOT STe). Maybe
>something got messed up? I have an STE, TOS 1.62 still.

Yeah, I'd say you heard wrong. TOS 2.06 IS the latest version for STEs; I own a MegaSTE with it installed and it works perfect. TOS 2.06 fixes some bugs in TOS 2.05, among them the "mono shift" bug. It's possible that 520 and 1040 STEs require TOS 1.62, but I doubt it.

1175. ibm binary download on atari

Newsgroup: comp.sys.atari.st
Date: 1994-07-25 15:25:08 UTC
From: nicole@seas.smu.edu
Message-ID: <1994Jul25.152508.25652@seas.smu.edu>
Source record: 183215

I get my internet access on an atarist at home. My wife uses an ibm clone in her office. Her coworker wants viet, a PD dos vietnamese wordprocessor. Though we've had no trouble reading atari-formatted and -written text files on the dos machine, we get a "can't read disk" sort of error on the disk where we unzipped the vietnamese wordprocessor.

I figure the problem could be in unzipping on atari, or in some difference in how dos treats binary files v. text files, or some other problem. Before I unzip on the mainframe and download the unzipped kit-n-kaboodle, I hope to find out if this is likely to fix the problem, or if I need to find someone with an ibm who's connected; or more likely just blow the thing off.

Thanks
John Trimble

> 1.62 back in. Now I do not get STE stereo sound. WHY!!!

In order to get TOS 2.06 to work on a 1040STe, you have to cut two
resistors and resoldier them at different spots. This tells the
machine to look for 28-pin chips instead of 24-pin chips. I did this,
and TOS 2.06 works fine now on my machine. I can send a copy of the
schematic to anyone who needs it.

As to the stereo sound problem, I have no idea.

Roger, even I find it hard to believe that you have the gall to openly admit to piracy in this public forum, to advocate piracy to others, to flame those who denounce piracy, and still bitch about the level of support you think you deserve from fine companies such as ICD.

Your comments trying to rationalize the piracy of Atari TOS ROMs don't make sense. No matter how you try to justify it, it's still an ILLEGAL activity. Add the last I heard, TOS 1.62 ROMS were still available as a repair part.

If you think nothing of stealing ROM code, you probably feel the same way about _any_ software, regardless of the medium it is recorded on.

You apparently have never heard about "International Copyright Laws." Countries may enforce those laws differently, but the rights still exist. And regardless of any written law, you still KNOW what is right vs wrong.

And pray tell, what "illegal" things has Atari done that makes you feel justified in advocating THEFT of their copyrighted code?

Software piracy exists. It likely always will, to one extent or another. I can accept that even though I don't like it. What I will NOT tolerate are people that are so callous and uncaring as to publicly promote the fantasy that a form of 'piracy is OK.' That's a slap in the face of developers everywhere.

It DOES hurt people, Roger. First the developer and then the user. Read Charles Smeton's post about the actions he has been forced to take due to the rampant pirating of his fax software. No, piracy is not the cause of Atari's recent decline... but it IS a contributing factor!

I always knew you were very 'vocal,' Roger, but I never thought you a pirate.

-Hutch- @ Fair Dinkum Tech

P.S.: I apologize for the cross-posting of this reply but I consider it an important issue (see comp.sys.atari.st.tech for the full text of messages).

> I wondering what to expect...

Actually, many MIDI programs do work, but most need singletasking. The
other problem, is that most MIDI programs expect to be alone. Therefore,
you usually can't expect to run more than one at once (since they all
want exclusive access to the MIDI ports). I haven't tried the programs
you've mentioned, but previous experience with Dr T's software has been
very good.

Mike Morris (mike@divsun.unige.ch) wrote:
> My manual said this was done - but I don't have the list :-(

I think you might be refering to the internal list Geneva has built-in,
which tells it how to run many troublesome programs.

> Could anybody post one, perhaps? Or even better could Gribnif maintain
> one at an ftp site?

It's not as easy as it sounds. People all the time tell us that things
work, but we are unable to verify that until we try an actual copy of the
program. Instead, we encourage users to pass this kind of information
around. However, the list will be a lot shorter if you keep track of what
doesn't work and why, rather than what works.

We don't have good/regular access to FTP sites, so we would not be able
(nor do we have the manpower) to maintain such a list.

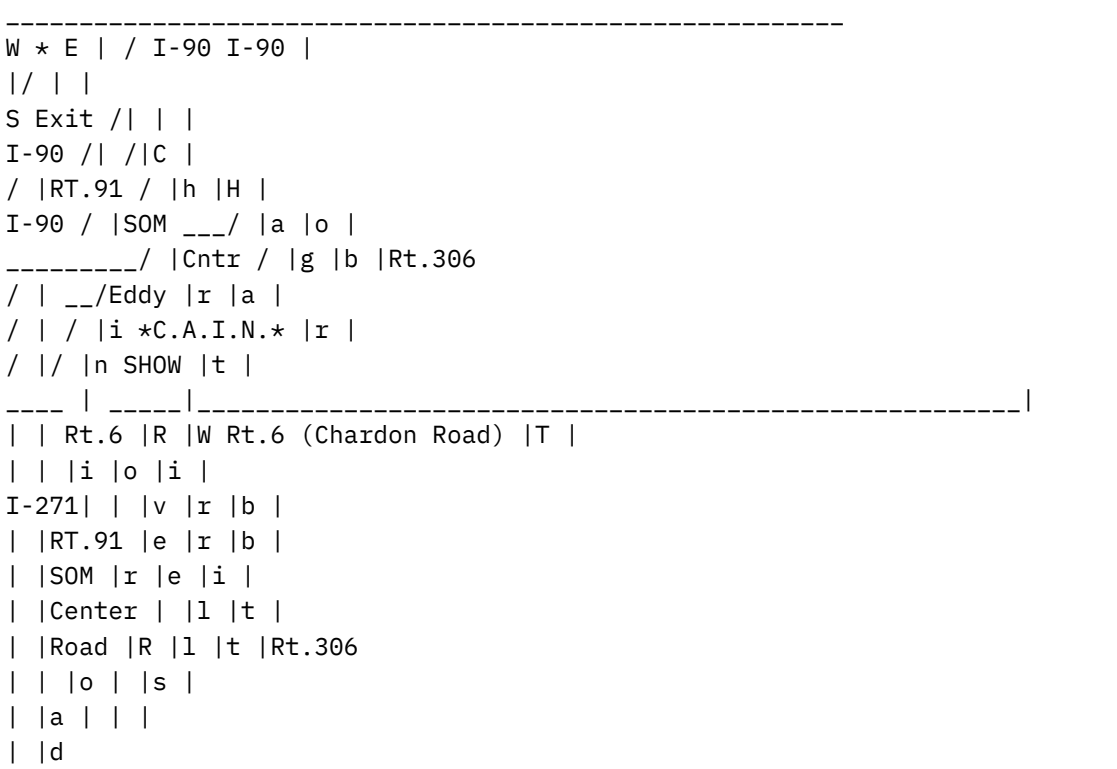
Ok, the directions posted along with the CAIN Atari Fun Fest 94 Show Announcements (a few days ago) is inaccurate. These are not only more accurate but less confusing!

Map to CAIN Atari Fun Fest 94

Knights of Columbus Hall, 7637 Chardon Road, Kirtland, Ohio

Map to all the Fun!



If traveling I-271 North, keep going North then take I-90 East to Route 91 (SOM Center Rd.). You will go South on Rt.91 to Rt.6 (Chardon Rd.) where you will go East for several miles until you are at 7637 Chardon Road.

If traveling I-90 South, exit at Bishop Road and head South until you reach Chardon Road. You will then go East for several miles until you are at 7637 Chardon Road.

If traveling I-90 West, keep going West then exit at Route 306. You will go South on Rt.306 (passing Eagle) to Rt.6 (Chardon Rd.) where you will go West for several miles until you are at 7637 Chardon Road.

: clone in her office. Her coworker wants viet, a PD dos vietnamese
: wordprocessor. Though we've had no trouble reading atari-formatted
: and -written text files on the dos machine, we get a "can't read disk"
: sort of error on the disk where we unzipped the vietnamese
: wordprocessor.
:
: I figure the problem could be in unzipping on atari, or in some
: difference in how dos treats binary files v. text files, or some other
: problem. [...]

If you get a "can't read disk" type error, the problem is probably with
the disk, not with the zip file format. Problems may be (1) damaged disk
and (2) disk formatted on Atari with old TOS version. To fix (1), try
copying the disk to another disk on the Atari -- it might be that the
data is still readable by the Atari, sometimes such situations arise
when the disk drives of the two computers involved are slightly differently
aligned or somesuch. To fix (2), format a 720K disk on your DOS box and
copy the zip file onto that with your Atari. DOS formatted disks remain
DOS readable when files are written to them with an Atari. Just be sure
to format disks to 720 K capacity (use format b: /t:80 /n:9 on DOS to
format disk in drive b:). Unless you use a TT, of course.

>The same would have happened with Neo4 this year, had I made it.

Ahhhh, but had you attended Indianapolis, you would have had the opportunity to have tried Neo 4 and Geneva. I would have posted a bit more about them in my article but I wasn't sure which features came from which program. More once I learn a bit more. The pair worked well together.

>To developers: do not let "creeping featurism" cause delivery schedules
>to slip. I am now undecided about the Neo4 upgrade.

You may be undecided, but I'm not. The IN show satisfied my curiosity. I liked the feel of Neo 4 and Geneva. It was there - running, and you could play with it. I showed Gribnif my support by voting with my plastic. I have a lot of their software already and am happy with it. I feel they are one of the good guys. I'm already playing with Geneva and next week when Neo 4 arrives I can concentrate on Neo.

Sure it would have been nice if Neo 4 had been ready then, but there was enough stuff at the IN show that I will be plenty busy till Neo arrives. Wayne

1188. Lightning Damaged ST. Please help

Newsgroup: comp.sys.atari.st
Date: 1994-07-25 19:00:13 UTC
From: S.P.Taylor@bradford.ac.uk
Message-ID: <1994Jul25.190013.20489@bradford.ac.uk>
Source record: 183227

Please can you help.

All of a sudden, when I came to use my modem, it was no longer sending any characters to the terminal. At first I blamed the modem, but after trying it on another ST, it was found that my ST is at fault.

The only thing which occurred between it working perfectly, and not, was a lightning storm near my home. This froze the ST on 2 occasions, but I thought this was the only problem.

The problem is that no characters are sent from the modem to my ST, but characters are sent perfectly the other way: e.g. I can type atdt# and it dials the number, producing all the correct sounds, but no chars are sent to the ST.

If anyone has experienced anything similar, and/or has a fix (??) please get in touch by Email.

Thanks.

To be good, better or ...

I'm not expecting, that nobody has actually tested CyReL Sunrise M16-1280 in Medusa (yet), but TT should be close enough to Medusa that possible problems and strong points can be located. Sunrise seems to be very powerful graphics card and Medusa is such a computer, which needs that power to be useful. For DTP, animation or retouching, all areas are important and now I really need information.

Sunrise M16-1280 cost a lot, so for that money it must be good or even excellent. What I need is Your opinion about this card, is it really worth it?

Message-ID: <DARYL.94Jul25161347@piano.adept.ih.att.com>
Source record: 183231

The good news, is that we are done. Right now all that is left is for me to finish the index to the manual, get it to the printer, and we ship. Since it only takes the printer 3-4 days to deliver, I figure we will be shipping by mid next week. Again, I'm very sorry for the delay, but I think that in the end you will be very happy with the results.

NeoDesk 4 incorporates many new features and capabilities which are not only new to the Atari, but unique among most other operating system. It is a great showpiece of how powerful the Atari is and how much fun it is to use (I'll stop now, as I hate sounding like an ad, especially over the internet ;-).

We are very committed to supporting the Atari and seriously plan to continue supporting it for years to come.

--Rick

Great news and a great response. I may upgrade and get geneva as well. Haven't decided yet.

I really hope Neo4 did not miss its market window. I am pretty disappointed with the current crop of personal computers and will not be replacing my Atari anytime soon.

A suggestion: make sure the upgrade policies are easy. I do NOT want to (snail) mail my old disks in if I am in your customer database.

Good luck.

ATARI Happening in Elmshorn/North Germany
-----------------------------------------

Announcement Update 07/22/1994
------------------------------

Computer Club Elmshorn e.V.
ATARI ST/TT/FALCON group
Postfach 261
D-25302 Elmshorn
Germany
Tel. 04121/83298
FAX 04121/82016

This is the fourth english announcement for the 5th Elmshorner
Computertage from the Computer Club Elmshorn e.V. On 29th and 30th
october is a big systemindependent computer exhibition in Elmshorn.
Elmshorn is a city 30 km north of Hamburg. The ECT has 10000 visitors
on average.

The exhibition are organized by the CCE e.V. and the city of Elmshorn.
The CCE e.V. is one of the biggest german systemindependent computer
clubs.

More than 50% of the exhibitors are ATARI dealers, ATARI clubs, ATARI
software producers and ATARI freaks. It's no PC show, it's an ATARI
happening. It's the biggest ATARI exhibition in North Germany since
the ATARI CeBIT exhibition 1992 in Hannover.

Venue is the KGSE Elmshorn (Kooperative Gesamtschule Elmshorn), the
street called 'Hainholzer Damm'. You can easy reach Elmshorn by train
or motorway. We will put landmaps as IMG images next time in the
BBS.

Exhibition opening:
Saturday 29th october 2 - 6pm
Sunday 30th october 10am - 5pm
- no admission fee

- additional : - big cafeteria
- tombola (we hope, that we get a FALCON computer
for the tombola, please read our next
updates)
- separate product presentations

ATARI exhibitors on the happening Update: 22th july 94
------------------------------------------------------
```

- CrazyBits, Berlin (PixArt,thermo sublimation color printer, FALCON's, ATARI hard-/software etc.)

- Betz Computer, ATARI dealer (Medusa T40, GE-SOFT Eagle TT, FALCON-Tower, ATARI hardware etc.)

- Layout Service Kiel, ATARI dealer (ATARI hard-/software, FFT, GAL-ED, FALCON, Jaguar etc.)

- Hinsch & Partner, ATARI dealer (ATARI game dealer, Jaguar, FALCON etc.)

- Computer & Service Kiel, ATARI dealer (ATARI hard-/software, (DTP, FALCON's, TT's etc.)

- VHF Computer, Schoenaich (Janus ATARI board for PC, Platon PCB etc.)

- Pagedown, Goettingen, ATARI dealer (Script 3.5, Purix Formula etc.)

- Jochen Merz Software, Duisburg, (Networks SMS2 realtime operating system)

- Columbus Soft, Darmstadt (Ergo Pro GFA BASIC developing system)

- Hahn's DTP, Elmshorn (Calamus SL DTP)

- Softwarehaus Alexander Heinrich, Kaiserslautern (Maxidat, Videotext)

- GALACTIC, Essen (Sampler, Harddiscrecording)

- Trifolium, Kassel (MIDI/Music applications)

- CD Vertrieb Bernd Lohrum (ATARI CD's)

- R.O.M. logicware (Papyrus, Speedo-GDOS 5.0 etc.)

- OMIKRON Software, Pforzheim (OM-BASIC, KSPREAD, Mortimer etc.)

- ByTech Gbr, Berlin

- we are negotiated with many other ATARI and software dealer, please read next updates

- Computer Club Elmshorn e.V./ATARI ST/TT/FALCON group (FALCON's, TT's, ST's with ATARI applications, demos, Cubase MIDI, ATARI programmers etc.)

- A.C.T. e.V. ATARI Computer Team, Bremen

- Computer Club86, 74004 Heilbronn

- we hope, that foreign ATARI clubs are in Elmshorn, too !

Additional, we plan a big meeting of ATARI mailbox users with a restaurant visit on saturday evening etc. Please, contact Ole Marienhagen for this meeting ideas.

```
* ********************************************************************
* This is the first update of our exhibitor list and the result of *
* the first advertising week for our 5th ECT. I've invited more than *
* 100 hundred ATARI dealers and software producers. *
* We will update this list every week ! *
********************************************************************

--------------------------------------------------------------------------
This is a message is for all european ATARI enthusiasts, especially for
our dutch, scandinavian, polish and british ATARI friends. Let's have a
big ATARI party and two nice days.

Jens Schulz
Manager of the ATARI ST/TT/FALCON group CCE e.V.
--------------------------------------------------------------------------

Foreign ATARI computer clubs or ATARI exhibitors are invited for this
great ATARI Happening, too.

- no cost for exhibitors (all free)
- CCE e.V. support exhibitors with tables/amperage
- advertising in the german ST computer magazine (12500 exhibition
catalogues 16-32 pages)

If you've questions about the exhibition, please contact Ole
Marienhagen by EMAIL (marienhagen@tu-harburg.d400.de)

If you will get an exhibition stand. please contact us immediately,
because many other ATARI and PC exhibitors will order exhibition
place, too. Please, use this registration form for an exhibition stand.

We will send back for the exhibition confirmation and exhibition stand
reservation.

Let's have a big european ATARI party.

--------------------------------------------------------------------------

Registration form for the 5th Elmshorner Computertage

Hi! And thanks for great NH 3.13d for GEM..!

No matter how great a game NetHack is - and how good your GEM conversion really is, too - there is one thing difficult to get rid of, unless one owns the fabulous Medusa T-40 computer with its 26 MIPS power...

That's slowliness... Under MultiTOS (or Geneva, too..) even a TT becomes painfully slow when things get "hot" in NH. That made me wonder, if there'd be something to be done to that?

First, is the current 3.13d version optimized for 68030? I think most serious NH for GEM players use either a TT, a Falcon, or some other accelerated Atari computer. That's because the game is almost unplayably slow in even a MSTE - and without decent 16 color graphics (640x400 =>), the result is poor, anyway. So, maybe it'd be wise to squeeze every bit of power from 68030/40 CPUs, as to make the game a bit faster..?

Second, as F-030 has the powerful DSP-56001 chip, it's really a shame it isn't used in most programs at all. I don't think supporting it is very easy - but I can't help wondering if DSP couldn't be used to do at least some of the heaviest calculations in NH ? The support could be modular, like is some graphics programs: when the program detects a computer using DSP, it'd load certain sub-routines - otherwise it'd load some others.

I doubt you (or anyone) have time to do that - but anyway, it's an idea. And I think, we Falcon owners would appreciate DSP-support a lot =-) !

Greetings,

Tommi.

I've often though about this for exactly the same reasons. Its definately possible, but not particularly worthwhile. You'd have to write extensions to the OS, and sort out some sort of highspeed link between them.

I've restricted my thoughts in this direction to networking my 2 STs with MiNT-Net. It looks hopeful, but MiNT-Net is still very much in the Alpha stages of development ;-)

GNU Flex and GNU Bison have both been ported. Berkley(?) Byacc - which is
closer to Yacc than Bison, has also been ported.

They must be available on some FTP site somewhere. The've been around the
PD Libraries in the UK for years.

Zmodem does have bugs in it. I have the same problem, though since I
rarely have need for zmodem, I haven't figured out if it is just a
difference in settings between Storm and the file-server. Make sure you
also d-l'd the zmodem patch (you need Storm 1.00, patch->1.01, patch->1.02,
and the zmodem patch to 1.02). As far as I know, Alan will be getting back
to working on Storm sometime in the next month; he's been really busy
lately. Hopefully zmodem will be fixed then.

Please get real Hutch, were do you take your Atari for service Their is none, and UK firms are selling Copies of TOS 1.4 that are not from Atari, and from what I have seen TOS 2.06 as well..

I will still state copies of Atari ROM's like 1.62 do not hurt any one, get some facts on what copyright is all about, I do think you just don't know..

Atari should replace all faulty copies of its Roms/DMA Shifter chips under are Sales acts, but does it, No !....

My fealings are that if the person has a legit copy of TOS 1.60 he has the right to get this replaced by any meens possible, this is not Breaking any so called supid USA copyright laws.....

So stop acting like God, you are not.....

I have had the same problem with Storm's Zmodem and my Internet Unix server. Storm's Zmodem DOES work with GEnie, Codehead BBS, and another PC BBS I call. Now I use Ymodem-G for Internet stuff, it's just not automatic. From what I hear Storm's Zmodem works best on a Falcon and worst on a TT. ???? Otherwise, I like Storm too.

>256 hi res.

This may be one of my ports of version 3.1.1, which worked much better
on Falcons than the later 3.1.3. I have seen copies of version 3.1.1
on some German FTP sites.

Good news is that I strongly suspect I solved the slow-down problem
today (found bug), so when I release the next version (ie. when the
DevTeam release another version), all should be fixed. I'll also
distribute a GEM version of the recover program, so that even if it
crashes while you're playing, you can still recover your game and
continue!

Just some of my thoughts, take them any way
you like...

People refer to Theft as egual to Piracy..!!!

My equations goes like this Software Authors/Programers
egual Pirates....

How come some one can produce a Article for sale (Software)
and find that there are no guarantee that it will work, its often
refered to as Sold as is...???

Also it is often stated you don't own the article at all (Software)
you are only leasing it..? my thouhts are I payed for it I own it, and I can do
what I like with it.

Also they claim that you can't alter it or touch it in any way,

Please Please can I trash your piece of Rubish software....!!

They also claim that if this Article does any damage that they are no liable,
so if it wipes you hard drive tough luck.!!

Plus to get this Article fixed if its faulty (Bugs) you have to Pay..!!

With Laws such as this you deserve to be ripted off, its called tit for tat..

Theft is Theft no matter how you look at it....

Posted to combat this allmighty God like attitude that some Programers/Authors
have..

So Programers/Authors Please take a look at yourselfs as others might look at
you....!!!

PLease note: these are just my fealings on the subject, no one has to take them
personally, but as they say, if the cap fits wear it....

Hello again, thanks for the reply, I am glad to know I am
not the only person having the problem.
I have come up with a solution for the time being until the
problem with Zmodem is solved for this otherwise stunning terminal
program.
I have attached a Storm Basic string to Alt-Z that calls
Alan Hamiltons XYZ202b.TTP, downloads the zmodem file, and
returns to the program.
If you want to add this to your Alt-Z:
EXEC 0,"D:\COMM\STORM\SYSTEM\XYZ.TTP","D:\COMM\DOWNLOAD"
(rename the directory names for your set up), it should work
great. It is not automatic, or in the background like Storms
Zmodem should be, but hey, it works and it gives good
throughput.
I am going to try and contact Mr. Page and see if there is a
patch for this problem.
-clark

AS I stated earlier, the Canadian list is $150!! I personally
sell them for $130. As for the Megafile, we are talking about
someone who does not even have a HD for their present ST system.
I agree that a person could do better buying new and a larger
disk at that, but our fellow Atari user is selling a Megafile.
In this part of the globe, $300 is the rough going rate!

Did you load in the zmodem.emu in the File Transfer section under the Settings
drop down.

Or did you set a download path....

Those are the only things I colud think of. Hope that helps.

Chris

Thanks for the tip, I'll give it try. I might as well since I regi$tered XYZ.TTP. Have you tried Ymodem-G? It seems just as fast as Zmodem and only requires a few mouse clicks. I love the background downloading. I'm totally amazed that I can do file maintenance (opening files, deleting files, etc.) while downloading!

In regard to contacting Alan Page, you'll have to go to the end of a very long line. :) Storm is an outstanding program that has been apparently abandoned for several months. Although given Alan's history I suspect he will return. BTW where did this rumor about returning in August come from? I haven't heard anything on GEnie.

Gemini? Pass. I was surprised it was as tolerant of strange accs and things as it is.
Now the hard-drive bug is fixed I think anyone who it still doesn't work for its
their fault (grin).

Dave

1217. Not exactly an ST enquiry, but...

Hi People,

This message is not exactly to do with the ST, but since this group is read by a great many folks from Germany, I thought I'd ask...

I'm taking a holiday in Germany at the beginning of September near Heidelberg. We plan to stop over near Koeln to break up the journey. Can any of you German folks recommend a chain of family hotels/motels to stay in overnight? I guess email responses would be best, unless everyone else on c.s.a.st is planning the same trip! ;-) Thanks in advance for any tips.

Tschuess,

I have written up a "Starball Hints and Tips" file. Here it is, printed
in its entirety (with help from Dave Oldcorn -- thanks Dave!) so
hopefully this will answer a number of questions asked.

(If anyone, especially you, Dave, has any changes or alterations or
erorrs to point out by all means please do. :-)

---------------------------------[Cut Here]---------------------------------
Starball Hints and Tips
Compiled by: Eric March
Revision 1.1, July 13th, 1994

Below are a list of all of the bonuses and the like that I have been able
to find in Starball. Some of these tips are also direct from the author
which I have specifically asked about.

Note: Lines starting with the # character denote new since last revision.

//
//// * Main Play Area * ////
//

==
== Spider Level (Bottom) ==
==

Objective
"""""""""
To get the ball into the spider's head to take you to to the Eggball
screen.

How to reach the objective
""""""""""""""""""""""""""
Each time you destroy all four of the coloured balls circling the
spider's body, they return as a new colour. Getting the ball into the
sink hole in the upper-left hand corner will cause something to happen,
depending on what colour the circling balls are.

Orange: First sink, bonus multiplier is increased.
Second sink, middle gate is opened for thirty seconds,
preventing the ball from being lost between the flippers

Light Gray: Middle gate is opened for thirty seconds. (see above)

Dark Gray: Bonus screen is highlighted. Get the ball into the spider's
head, and you will be taken to Eggball (See Below)

Bonuses
"""""""

* Getting the ball below "Jimmy Hill" (the mummified bust on the right side of the screen) will give you a 100,000 point "Jimmy Hill Chin Bonus"
* Getting the ball into "Jimmy Hill's" mouth while open will give you whatever bonus you have accumulated.
* Surrounding each of the outlanes in the Starship level (see below) are two pulsing balls. If you shoot your ball up one side and it goes right down the other, destroying both balls, you will recieve a 100,000 point skill shot bonus
* Shooting the left and right bumpers on either side of the flippers causes them to get brighter. It will take eight shots to cause them to explode, and this will activate the kickback for the outlane on that side of the table.

Tips
""""

* Get your kickbacks lit for both sides
* Getting the ball into the spider's head when the bonus screen is not lit will (seemingly at random) teleport the ball to the Slime level (see below)
* Use the light gray bonus to your advantage; when you suspect that the middle gate will open soon, and the circling balls are still light gray, try and shoot for the sink hole; it will keep the gate raised for another thirty seconds.
* The sink hole is most easily accessed by shooting the ball from your left flipper and bouncing it off of the right bumper.
* Getting the ball up into the Starship level is most easily done by shooting the ball off the right-hand flipper and bouncing it off of the left-hand bumper.

==========
== Starship Level (Middle) ==
==========

Objective
"""""""""
To build your starship.

How to reach the objective
""""""""""""""""""""""""""
Destroying all of the circling ships on this level will give you a piece of your starship. There are nine pieces of the starship that need to be built. Once the ship is built, the ball is shot into the entrance located at the bottom of the ship between the flippers. This will take you to the Invaderball bonus screen. (see below)

Bonuses
"""""""

* Shooting the lower-left sink hole will produce a random bonus, which
can be anything from 1,000 points to taking you to a randomly selected
bonus level.
* The upper-left sink-hole, normally shielded by an energy beam which is
destroyed by shooting it twice, docks you at a starbase. Each
successive dock gives you a new bonus:

Starbase 1: Gives you one more piece of your ship
Starbase 2: Adds 10,000 points to your bonus
Starbase 3: Bonus Held
Starbase 4: Destroys side guns
Starbase 5: Super Bumpers activated (Gives you 2000+ points every time
the ball hits a piece of your ship; different pieces of
your ship yeild a higher or lower point total)
Starbase 6: Completes your ship
Starbase 7: Increases bonus multiplier
Starbase 8: Gives you 100,000 point bonus
Starbase 9: Takes you straight into a random bonus screen

Starbases roll around to start at 1 after you reach the 9th.

Tips
"""""

* Do NOT shoot the top-right hand sink hole. If the side guns are not
destroyed, it gives them two more hit points. If they are destroyed,
it fixes them up with two hit points, and successive sinks will
increase their hit points again by two.
* Kill the side guns FIRST, as these have the ability to destroy a
piece of your ship should their missiles be allowed to hit it.
* Use the Super Bumpers bonus to your advantage; this can increase your
score very quickly.
* Destroy the side guns by hand first, because once you enter the bonus
screen, everything returns to normal and the guns reappear. THEN use
this bonus to kill them again.

==========
== Slime Level (Top) ==
==========

Objective
"""""""""
To destroy the monk figures circling around the female's face in the top
left of the screen.

How to reach the objective
""""""""""""""""""""""""""
Destroy the monk figures until the face in the centre of the screen
becomes completely messed up. This will cause two large creatures
to appear. Killing them both opens up the bonus screen in the top of
the female's head on the top right. Getting the ball in here will
take you to Arkanoidball (see below). (Thanks to David Oldcorn for
this one)

Bonuses
"""""""

* Shooting the rightmost sink hole produces a random bonus.
* Shooting the four coloured bumpers surrounding the slime changes that bumper's colour. A bonus is given when all four bumpers are the same colour:

Red : First sink, extra ball
Consecutive sinks (on same ball), 500,000 point "Big Bonus"
Blue : Increase bonus multiplier. (If multiplier is already at 9x, a 200,000 point "Big Bonus" is given)
Green: Energise Ball. While the ball is energized, all points (including your own bonus points) accumulated are multiplied by 4x. (Thanks to David Oldcorn for the answer to this one)

* Shooting the leftmost sink hole on the right hand side will shoot the ball into the area where the monk figures are circling.

Tips
""""

* This level has the most potential for racking up lots of points. Most of all, go for the coloured posts, as they yield the biggest bonuses.
* Get the energize, as this multiplies all points you recieve while the ball is energised by four (including your own bonus points). This can lead to lots of points.

//
//// * Bonus Screens * ////
//

==
== Eggball ==
==

Objective
"""""""""
Destroy all four quadrants of the egg, and any insects that emerge from them.

Tips
""""

* Destroy three quadrants, and then spend time destroying the insects. You will rack up more points this way.
* Losing the ball will give you half (?) the bonus you normally would have gotten if you completed your objective.

==
== Invaderball ==
==

Objective
"""""""""

Destroy all the aliens.

Tips
""""

* Just don't lose the ball.

==
== Arkanoidball ==
==

Objective
"""""""""
Eliminate all bricks.

Tips
""""

* Destroy all but one (or a few) of the bricks, and then spend the rest
of your time destroying the little creatures that roam about. This
will help you rack up more points.

==
== Llamaball ==
==

Objective
"""""""""
Kill everything that moves.

How To Get Here
"""""""""""""""
First, the "Secret BS Mode" must be enabled; this is achieved by
getting the ball back down the shoot lane once you've shot it out.
The easiest way to do this is when you're about to shoot the ball. Pull
back the plunger just far enough so that the top of the ball is nearly
touching the first band of light gray colouring, then let go. The ball
will travel up just to the opening, then back down again, enabling the
Secret BS mode.
Once this mode is enabled, you must then get the ball into the
rightmost sink hole in the Slime level (top), which is normally
designated the "Time Warp"; you will get a message telling you what to
do next, which is to get the ball into "Jimmy Hill's" Mouth. Once you've
done that, a Llama will appear on the bottom level. Kill the Llama and
you will be taken to Llamaball.

Tips
""""

* This is the "barking mad bonus screen" mentioned in the docs. It is in
two stages. After you kill the first set of creatures, you'll have to
contend with a second set.

```
==============================================================================
== General hints and tips ==
==============================================================================

* Every time you exit from a bonus screen, everything is returned to
normal. This means the side guns return and your kickbacks are no
longer on. It's best to plan things ahead before entering a bonus
screen so that you can set things up when you exit. Generally this
means insuring that the bumpers on the Spider level are as bright as
they can be so that one hit will activate your kickbacks, and dock at
at the first three starbases in the Starship level, reading yourself
for the fourth docking that will destroy the side guns.
* If you are running the game on a stock ST or STE (non-accellerated),
switching into 50FPS mode (Hitting the "/" key) actually has the
effect of slowing the game down. This is good for beginners if the
game runs too quickly.
* Hitting the HELP key allows you to set the difficulty (gravity) of the
game. This feature isn't documented for some reason. The default
mode is Normal.
* Escape during a game will quit that game. (A second escape is
required to confirm your choice) This also doesn't seem to be
documented.
* Pressing "(" and ")" on the numeric keypad has the effect of changing
the Hz mode (50/60Hz). Also undocumented.
# * Quitting the game and returning to desktop is achieved during gameplay
# by hitting escape, and then hitting SHIFT+ESCAPE twice. (Undocumented,
# and may not work on the Falcon)

------------------------------------------------------------------------
Thanks to David Oldcorn for helping out with some of the hints and tips.
And, of course, for making this completely fantastic game in the first
place.
------------------------------------------------------------------------

I think the point that you are missing is that what you are paying for is not the product itself -- not entirely, anyway. You are paying for the time it took the author to develop the software. You are paying for the distributors and the store that helped bring it to you. (In the case of shareware, most of the time, it is simply a matter of paying for the author's time to develop such a product)

To call software developers pirates simply by the idea that they sell or request a donation for their software is a ludicrous assertion. I develop software. Why shouldn't I be at least in some way compensated for my efforts? I spent ten months working on FANSI. Am I to give it out free of charge and expect nothing in return? To say that those ten months were spent working hours each day on this program while still holding down a day job for nothing? If this is your position, then why? It seems hardly fair that you should get a program that you use and you find worthwhile for absolutely nothing if the programmer expects or requests some form of payment for it if you keep it and use it. If you don't like the program, don't pay for it. But to make the assertion that paying for a peice of software is the equivalent of contributing to your idea of piracy is just plain wrong no matter how you look at it.

I quite fancy boosting up the speed of my STe 'cos let's face it, multitasking does kill the machine!

1. Is there a noticable and WORTHWHILE increase in speed on going from 8 to 16MHz? If so, where can i get such an accelerator and for how much?

2. Would it be worth my while to cut the crap and just get either a T28 or T36 (or other) and run a turbocharged system? 180 pounds sterling seems a lot to do this though, as my ST is really just a hobby - my thesis will have to be written on a Mac (sin, sin, sin...) for compatibility reasons.

Currently, i just potter around on my system, dabbling with Calamus S and only use the ST with multitasking software.

Message-ID: <312pkf$qhu@infa.central.susx.ac.uk>
Source record: 183167

I need help.

I have a 4Mb STe with HD.

I managed to get GCC set up and running under gulam after a very long tussle with environmental variable after environmental variable (i'm not used to using software like this involving expanses of libray files etc).

I got the thing to compile software ok, even under MultiTOS.

I then converted to geneva and found i couldn't get gulam to work in a window. I therefore set the mtask FLAG to single tasking (also added an ENV_VARIABLE .CPX to XControl) and now am unable to compile - i get the error message can't find GNUEXEC=d:\gnu\gcc\gnuexec (or something along those lines). i.e. there's something afoot in my GEM.CNF file that now bugs GCC.

Right, can someone please tell me the complete set of files to get, where to put them and tell me what 'libraries' they are, as i want to wipe the folder and start again.

Thanks in advance.

Steven.

In <311pqm$kft@golem.wcc.govt.nz> sheppard_r@kosmos.wcc.govt.nz (Roger Sheppard.) writes:

First, I program in my spare time and also make my living with
computers--partly by programming. If I try to make money from that
effort, I believe there are two reasonable results:
A person likes what I've done and buys it, or
A person doesn't like it and ignores it.
The other two possibilities are unfair...that is, a person should not
use the results of my labour without paying AND I should not be able to
make someone pay for something they don't find usable. So, in a sense,
I think you're perfectly right that there's shold be a "tit for tat".
But by both sides acting reasonable rather than both sides acting like
criminals.

>People refer to Theft as egual to Piracy..!!!
...which isn't a really good equation, but at least counters some of the
cute, romantic connotations of the word pirate.

>How come some one can produce a Article for sale (Software)
>and find that there are no guarantee that it will work, its often
>refered to as Sold as is...???
Agreed. Most licensing agreements read as if they were written by
weasels. Unfortunately, I suspect that people with a nasty habit of
bringing law suits for ANYTHING have driven companies to hire lawyers
who create these "cover your ass" idiocies.
Most programmers I know would be ashamed to act that way...it would be
like disowning one of your children to give up all responsibility for
something you created.

>Also it is often stated you don't own the article at all (Software)
>you are only leasing it..? my thouhts are I payed for it I own it, and I can do
>what I like with it.
No more than a hotel room you rent. The conditions of the lease are
part of the product. Once again, if you have problems with any part of
the product (including the conditions), you get to ignore the product
entirely. If enough people feel likewise, the company goes broke...or
maybe changes a bad licensing policy.
Software consumers have made pretty good progress afainst hardware copy
protection by saying, "We ARE paying you and in return you're pissing us
off," to manufacturers.

> Please Please can I trash your piece of Rubish software....!!
Absolutely! If it's rubbish, don't buy it...but don't FRIGGIN' use it
either!

>With Laws such as this you deserve to be ripted off, its called tit for tat..
No, it's called wanting to rationalize being a cheap, greedy thief.

On my single tasking MSTE, most opperations (screen redraws and the like)
speed up by roughly a factor of 2. This is definitely noticable. For
Calamus, this means that you'll get a great deal more out of it in less
time. However, I would guess that for multitasking you would really need
something quite a bit faster. If you can afford it, go for the T36!

I'm surprised they haven't done a Falcon version of Brilliance -
the machines have quite similar capabilities and a port should
be pretty simple.

> (snail) mail my old disks in if I am in your customer database.

I'm sorry to say, we do have to require this. Mostly due to the large number of users who have sold their software used. This is required to "keep the honest people honest".

In the past when we've attempted to offer upgrades without requiring the master disk, months later we have seen someone else come and try to upgrade the original person's older version disks. In other words, we have two requests for upgrades off the same serial number! I really hate to tell the person who bought the older version that he can't upgrade (most used software buyers are innocent victims after all). So, we require the older version disks back, that way we can be sure that the person upgrading DOES still have that product and we can make sure that it does not (accidentally or intentionally) end up is someone else's hand.

I hope this long rambling letter made some sense...

> How come some one can produce a Article for sale (Software)
> and find that there are no guarantee that it will work, its often
> refered to as Sold as is...???

You are not paying for what the software is promised to do, but for what it does now. This difference is important, or we would find ourselves sued for every bug or limitation that someone ran into. Trust me, this has happened in the past to other developers.

> Also it is often stated you don't own the article at all (Software)
> you are only leasing it..? my thouhts are I payed for it I own it,
> and I can do what I like with it.

Do what with it? Make your own copies and sell them? See? It is important that the developer retain clear ownership of the product. If not, someone might try to do something that isn't protected by copyright (or not protected as well). BTW, you are not leasing it, you are licensing its use.

> Also they claim that you can't alter it or touch it in any way.

If you wrote a program. Would you want someone to go in and modify its code? And if they did, and then it erased someone's hard disk, would you want them to sue you (over a change you didn't even do)? See how these problems can get aggravated. Again, this exact example HAS happened. A database company had its program modified by a consultant. The database then damaged expensive records, and the end user sued the pants off the database company. They (the database company) are not in business any more.

> They also claim that if this Article does any damage that they are no liable,
> so if it wipes you hard drive tough luck.!!

See above. Most developers (especially Atari developers) are pretty poor. Just the legal costs for a lawsuit (even if they didn't lose it) would bankrupt us. These DISCLAIMERS are necessary to prevent these problems. Of course, this never really happens (at least I haven't heard of it happening), but you never know. If someone is too lazy to back up their hard disk, then drags the drive to the trashcan by accident, should they be able to sue us?

> Plus to get this Article fixed if its faulty (Bugs) you have to Pay..!!

Again, this is a defence mechanism. We have never charged someone to fix a bug they ran into (all the free patches we've uploaded to online

services prove this). But, if this wasn't in there, someone could sue a developer and demand that they fix a bug for free. In some cases that might be unrealistic (where fixing the bug will take so many resources, that it would bankrupt the developer).

> With Laws such as this you deserve to be ripted off, its called tit for tat..

Tit for tat? Doesn't that infer that we would first get something before we were ripped off? The truth is that we usually get nothing. In the Atari market, a best selling product can, at best, hope to sell to 10% of the current Atari market. Does that mean that the other 90% don't use that product? Take a guess. Find out how many people use UIS, QuickST, or NVDI and then ask them all if they bought it. I'm not blaming piracy for the current Atari market (I never have), but it is something that does affect us developers directly. Trust me, I never was able to buy that lovely house I always wanted.

> Theft is Theft no matter how you look at it....

For once, I completely agree with you.

There's not much difference cost-wise between some 16MHz accelerators
and the T28. Ring System Solutions on 081 693 3355, they used to do a
bundle of T28/T36 with NVDI, which went like greased lightning.

Yes, the improvement is about 70% overall with ADSpeed or similar boards.

>2. Would it be worth my while to cut the crap and just get either a T28

The T36 is probably too expensive, I recomend the T28 which gives almost
x3 increase in speed, especially if you also get NVDI.

The port of Emacs that I use also handles both formats; it saves in the
same format as it read the file in the first place, whichever that might
be. You can force conversion with "toggle-dos-mode".

>Please get real Hutch, were do you take your Atari for service Their is none,

While I will be the first to admit there is not an Atari dealer or repair center on every street corner, that's a far cry from saying there is NO place to have your machine repaired or purchase legitimate TOS ROMs.

>and UK firms are selling Copies of TOS 1.4 that are not from Atari, and from
>what I have seen TOS 2.06 as well..

If there are, in fact, UK firms selling unlicensed copies of Atari TOS ROMs, then they are doing so illegally... and that's not just by U.S. laws!

>I will still state copies of Atari ROM's like 1.62 do not hurt any one, get
>some facts on what copyright is all about, I do think you just don't know..

Actually, I tend to agree with you, in part... I don't believe that illegal sales of old Atari TOS ROMs will bankrupt Atari (they are quite capable of doing that on their own). But that does not make it right. Theft is theft.

And excuse me, but I think I _do_ know a little bit about copyrights, trademarks, patents, licensing and the international protection of the same. Like the man says, "Been there, done that, bought the t-shirt."

>My fealings are that if the person has a legit copy of TOS 1.60 he has the
>right to get this replaced by any meens possible, this is not Breaking any so
>called supid USA copyright laws.....

Ah, but the original poster wanted copies of other TOS versions as well.

>So stop acting like God, you are not.....

I would never presume to do so. I'm just one of a growing number of Atari users who has recognized the real damage that software piracy (in any form) can do. While I obviously can't stop it, I can at least try to educate others in hopes that more users will agree not to tolerate it anymore.

You make your own choices in life, Roger. But you have to live with them, too.

>nicole@seas.smu.edu

The Megafile30 contains a ACSI to ST506 adaptor. You might connect another ST506 (this is a "old" hard disk bus) hard drive to the adaptor, there is a second drive connector on it. Then you will have to tell HDX what kind of harddisk you inserted. (if i remember right, you will have to use an alien hard disk driver, because ahdi does not support the second drive).
If you want to upgrade your Megafile with a SCSI drive you might use the old case, but you will have to remove the old drive and the adaptor and replace it by an SCSI host adaptor.

Please please... can we cool down a bit? I can certainly see why many
folks are provoked by Roger's posting. His stuff strikes me as being
one-sided and lacking any ideas how to tackle the problem (e.g. alternative
systems of software distribution, such as the FSF's concept). OTOH,
his posting leaves me with the impression of being written by someone
who has been seriously bothered by some problems that simply do exist
with the current system of commercial software distribution. Calling
someone who is frustrated and probably annoyed by these problems a
"thief", a "jerk", or stating he shows "stupidity" is missing the real
point and won't do any good. It's merely a step towards a full-fledged,
pointless flame war.

First problem. gulam. gulam was only a beta, and is flakey on higher
TOS versions. watch out for it. it also isn't a multitasking program.

for a real shell, get the MiNT targeted TCSH.

as for gcc you need binutils, gcc, pml, gemlib, includes, and be sure to
follow the docs exactly ('/' vs '\' slashes, etc)

: what files do i need,

Try CS-TeX. It comes on 8 disks that are collected into 8 archive files.
One of the disks has an installation program that installs a ready-to-use
TeX system for yor. All you have to do is play diskjockey.
There's another TeX system called Lindner-TeX (or similar), I have never
seen it in use, so I cannot comment.

: where can i get them,

They are on many Atari ftp sites. Check src.doc.ic.ac.uk, look for a
directory called something like Tex/Cstex in the atari area
(packages/atari/umich on s.d.i.a.u). The 8 files mentioned above should
sit there. I don't know their names, but you'll know when you see them ;-) .

: how much space do they need,

Well, 8 disks * 720K makes a total of 5.8 MB. You'll need another 2 MB
or so to hold your texts and your processed data. I'd say 6 MB should
suffice to install and check out the system, more is probably necessary
for any serious work.

: will 4Mb be enough.

If you mean RAM, yes, if you mean HD space, no (see above).

Greetinx, Jan

Thanks, I'll keep my eyes open. Do you know what sort of price we're
talking about, just for a basic 2 meg with no HD job?
Oh, and does the TT take standard 72(?) pin 32 bit Simms for the fast
TT-RAM? I guess the memory that comes with it when you buy it new
is just normal ST-RAM?

1257. Multitasking (yep - again !)

Newsgroup: comp.sys.atari.st
Date: 1994-07-26 19:54:14 UTC
From: martin@kitome.demon.co.uk
Message-ID: <775252454snz@kitome.demon.co.uk>
Source record: 183110

Hi all,

Now I've got my Mega STe upto a full 4 Mbytes of memory (are the Marpet boards available for STe's yet BTW ?) I'm interested in getting a multitasking, or task switching at least, system running. I thought about MiNT, but after a rather unsuccesful attempt with the distrib. kit a while ago, gave up on that - mind you, being able to access WWW using Lynx via demon might yet tempt me ... . Other than that though, current opinion seems to be split between Magic/Ease and Geneva/Neodesk 4. Anyone want to post opinions on useability/compatibility etc. ? (mail perfectly acceptable if this has been discussed to death already and I missed it!)

Also, do either of the above systems support extended file systems like Minix under MiNT?

Later,

Martin

I agree with the position you present in the first two sentences above,
but not in the logic of the third. *Mostly*, the people who steal
software wouldn't buy it anyway...they're too cheap.

The companies that claim they're losing a mint to piracy are just
pulling numbers out of thin air to make a big case and impress the law
makers/enforcers. Even if they could shut down every one of the warez
dweebz, it wouldn't add a cent to their profits. (On the other hand,
focussing on corporate-level theft *might* get them a few extra
dollars...but not those in the Atari software business.)

1261. Atari-Show in Elmshorn (near Hamburg)

ATARI Happening in Elmshorn/North Germany
-----------------------------------------

Announcement Update 07/26/1994
------------------------------

Computer Club Elmshorn e.V.
ATARI ST/TT/FALCON group
Postfach 261
D-25302 Elmshorn
Germany
Tel. 04121/83298
FAX 04121/82016

This is the fourth english announcement for the 5th Elmshorner
Computertage from the Computer Club Elmshorn e.V. On 29th and 30th
october is a big systemindependent computer exhibition in Elmshorn.
Elmshorn is a city 30 km north of Hamburg. The ECT has 10000 visitors
on average.

The exhibition are organized by the CCE e.V. and the city of Elmshorn.
The CCE e.V. is one of the biggest german systemindependent computer
clubs.

More than 50% of the exhibitors are ATARI dealers, ATARI clubs, ATARI
software producers and ATARI freaks. It's no PC show, it's an ATARI
happening. It's the biggest ATARI exhibition in North Germany since
the ATARI CeBIT exhibition 1992 in Hannover.

Venue is the KGSE Elmshorn (Kooperative Gesamtschule Elmshorn), the
street called 'Hainholzer Damm'. You can easy reach Elmshorn by train
or motorway. We will put landmaps as IMG images next time in the
BBS.

Exhibition opening:
Saturday 29th october 2 - 6pm
Sunday 30th october 10am - 5pm
- no admission fee

- additional : - big cafeteria
- tombola (we hope, that we get a FALCON computer
for the tombola, please read our next
updates)
- separate product presentations

ATARI exhibitors on the happening Update: 26th july 94
------------------------------------------------------
```

- CrazyBits, Berlin (PixArt,thermo sublimation color printer, FALCON's, ATARI hard-/software etc.)

- Betz Computer, ATARI dealer (Medusa T40, GE-SOFT Eagle TT, FALCON-Tower, ATARI hardware etc.)

- Layout Service Kiel, ATARI dealer (ATARI hard-/software, FFT, GAL-ED, FALCON, Jaguar etc.)

- Hinsch & Partner, ATARI dealer (ATARI game dealer, Jaguar, FALCON etc.)

- Computer & Service Kiel, ATARI dealer (ATARI hard-/software, (DTP, FALCON's, TT's etc.)

- VHF Computer, Schoenaich (Janus ATARI board for PC, Platon PCB etc.)

- Pagedown, Goettingen, ATARI dealer (Script 3.5, Purix Formula etc.)

- Jochen Merz Software, Duisburg, (Networks SMS2 realtime operating system)

- Columbus Soft, Darmstadt (Ergo Pro GFA BASIC developing system)

- Hahn's DTP, Elmshorn (Calamus SL DTP)

- Softwarehaus Alexander Heinrich, Kaiserslautern (Maxidat, Videotext)

- GALACTIC, Essen (Sampler, Harddiscrecording)

- Trifolium, Kassel (MIDI/Music applications)

- CD Vertrieb Bernd Lohrum (ATARI CD's)

- R.O.M. logicware (Papyrus, Speedo-GDOS 5.0 etc.)

- OMIKRON Software, Pforzheim (OM-BASIC, KSPREAD, Mortimer etc.)

- ByTech GbR, Berlin (OFF-AXIS plotting soft for measured values)

- Behne & Behne, Wunstorf (NVDI)

- SciLab, Hamburg (Xact graphics presentation soft)

- we are negotiated with many other ATARI and software dealer, please read next updates

- Computer Club Elmshorn e.V./ATARI ST/TT/FALCON group (FALCON's, TT's, ST's with ATARI applications, demos, Cubase MIDI, ATARI programmers etc.)

- A.C.T. e.V. ATARI Computer Team, Bremen

- Computer Club86, 74004 Heilbronn

- we hope, that foreign ATARI clubs are in Elmshorn, too !

Additional, we plan a big meeting of ATARI mailbox users with a restaurant visit on saturday evening etc. Please, contact Ole Marienhagen for this meeting ideas.

```
* ********************************************************************
* This is the first update of our exhibitor list and the result of *
* the first advertising week for our 5th ECT. I've invited more than *
* 100 hundred ATARI dealers and software producers. *
* We will update this list every week ! *
**********************************************************************
```

This is a message is for all european ATARI enthusiasts, especially for our dutch, scandinavian, polish and british ATARI friends. Let's have a big ATARI party and two nice days.

Jens Schulz
Manager of the ATARI ST/TT/FALCON group CCE e.V.

Foreign ATARI computer clubs or ATARI exhibitors are invited for this great ATARI Happening, too.

- no cost for exhibitors (all free)
- CCE e.V. support exhibitors with tables/amperage
- advertising in the german ST computer magazine (12500 exhibition catalogues 16-32 pages)

If you've questions about the exhibition, please contact Ole Marienhagen by EMAIL (marienhagen@tu-harburg.d400.de)

If you will get an exhibition stand. please contact us immediately, because many other ATARI and PC exhibitors will order exhibition place, too. Please, use this registration form for an exhibition stand.

We will send back for the exhibition confirmation and exhibition stand reservation.

Let's have a big european ATARI party.

Registration form for the 5th Elmshorner Computertage

Computer Club Elmshorn e.V.
Postfach 261
D-25302 Elmshorn
Germany

Registration for the 5th Elmshorner Computertage
on 29th/30th Oktober 1994

1262. Argh! Adspeed upgrade woes...

Newsgroup: comp.sys.atari.st
Date: 1994-07-26 20:54:55 UTC
From: mattk@netcom.com
Message-ID: <mattkCtKFFK.11K@netcom.com>
Source record: 183200

Hi all...here's a quick story so far....

I put in an Adspeed into my 1040STF rev D board. I had to fix a few bad traces, but it seems to work fine... My system has a XtraRam Deluxe with 4 megs in it and the tos 2.06 upgrade by Ted Rossin.

Here's the weird part...ANY time I try to use it with my hard drive, which is a Quantum LPS540S and a AdSCSI Plus, I get bombs, system resets, etc. Basically, it doesn't work. But, when it is off, and I am using the floppy, the system works. I've been usin Storm for over a half hour today (here I am now!) with no problems.

I'm calling ICD on Wednesday, and talking to my dealer today. I just wanted to know if anyone else had problems with this setup.

Bye for now,
Matt <mattk@netcom.com>

>heavy-handed, they HAVE TO! It never used to be like this...be then the
>pirates came....
>

Those programmers could of course do something REAL for living... I never expected to become very rich from MY programming efforts... Fact is that by programming for Atari computers you will never earn a decent income (anymore)... Too bad but fact is fact.

The whole system is wrong. If I buy a bread toaster for say $25, I open the package at home (not allowed in the store because of immediate agreement with the rules and regulations on the outside..) only to find out that I need a separate cable and a plug to connect it (referring to crippleware) You can get it to work when you send the maker of the product an extra $10 or so...
That stinks, no one would buy such a product.

I bought a set of CD-UTILS ($50) for my SCSI CD-ROM player only to find out that it also wouldn't read all CD-ROM titles. Ok you can get an update for $?? and also no guarantee... I recently bought a CD-ROM player for my PC and with it came a nice little driver which hasn't got any problems reading whatever CD-ROM disc, the cost of this Mitsumi player was: $75 !!!!! Ok, ok, it's single speed but my SCSI drive for the TT cost me $300 !! Atari computers just aren't any fun anymore, everything for it is expensive (graphic cards, harddrives, memory expansions, you name it)

I'm not interested in putting my whole salary into my TT !! So I admit I sometimes also 'try' software... Here in Holland it is almost impossible to go and look for decent software for the Atari, for a PC you can get everything on every streetcorner. I don't like PC's, I don't like VHS videos either but fact is THEY make the rules.

Gert

1264. Information wanted

Newsgroup: comp.sys.atari.st
Date: 1994-07-26 22:34:27 UTC
From: tony@triode.apana.org.au
Message-ID: <31431j$n1t@triode.apana.org.au>
Source record: 183102

I need a little help from an German guys on the net.

I'll set the scene a little first.

I'm a programmer in Australia and around the start of the year I finished a product for the STE/TT/Falcon called Art For Kids, it is quite an extensive 'fun art' program with lots of sound effects etc. I was contacted by a Wolfgang Meinberg of Nautillus computer who was interested in publishing the product in Europe and the UK. We had a lot of discussion via Email on Compuserve and I gave him the rights to the product. He was publishing the game under another company name, Wizard.

Since I sent him complete versions of the product and manual etc. he has been out of conact and I beleive he has ripped me off. What I'd like is any information you guys may have regarding either comapany or the fellow himself. The address and phone numbers I have are as follows:

Wizard
Apostel-Paulus-Strasse 1
10823 Berlin
Tel 030 787 5821
Fax ''''''''''20

I'd really appreciate it if anyone can help, I get no response when I call either number. It's as though he has moved and taken my program with him. If anyone has seen the program advertised or for sale anywhere I'd also be interested in hearing that.

I could really use the help, thanks

Tony Barker

Source record: 183103

>1. Is there a noticable and WORTHWHILE increase in speed on going from 8
>to 16MHz? If so, where can i get such an accelerator and for how much?

Yes.

>2. Would it be worth my while to cut the crap and just get either a T28
>or T36 (or other) and run a turbocharged system? 180 pounds sterling

Yes. Two years ago I bought a MSTE to replace my aging STM. This was an
upgrade from 8 to 16Mhz. The speed increase soon wears off though, and
now my MSTE is barely adeqaute for MiNT/MTOS work, while my STM is
pathetically slow. I'm aiming for a PAK/3 (32Mhz 68030) upgrade, but as this
is going to cost over 400ukp, I'm still pondering (in both senses ;-)

:-)

Roland.

From: rgivan@cix.compulink.co.uk
Message-ID: <CtKn4M.FB2@cix.compulink.co.uk>
Source record: 183107

> What is Gulam ? And how can I make GCC run under my Falcon ?

Gulam is an ancient (1987) program which gives you many of the basic facilites of the Unix csh shell. It has all the standard shell utilites built in, and was very popular for running C compilers.

Its obsolete nowadays, as people tend to go for heavy duty Unix like setups (based on MiNT and MinixFS), or combination systems like Lattice. However for people short of RAM and/or diskspace - who can live with Gulam's incompatibilities (not very MiNT friendly), then Gulam is still very good.

Long time ago I wrote an install guide (~20K) for GCC 2.01 and Gulam. Its a bit 'micky mouse' and out of date, but I'll happily mail it to anybody, or post it if anybody wants it.

:-)

>

The problem is, if you buy a peace of software which doesn't work they way
it was suppose to. Whats there to do ? now you'r stuck with a program you
have paid for, but it doesn't work. Often you can't get a refund, cause the
dealer/author will not know if you just got it to crack it.

Second, you can get a software which do some damage on your equipment, (like
lose some data on your harddrive), just because of some stupid bug in the
program.. Who gona pay for this ? again it's the custumor who only took
the time/chance to support it.

My idea is, everything should be released as shareware, so the publich can
test it before paying anything. I know you did release FANSI as a demo
version. But what about those funktions which has been limited for registred
user only. How am i going to tell if they'll work. I can only assume it'll
work, and if it doesn't, it's just bad luck.
There is allways a chance with Pd and shareware products, but there shouldn't
be with commercial programs. Unfortunatly i have seen this.

Programmers who do software which are working should be paid for their job.
But can we, as custumors, demand the programmers software beeing tested 100%
before released ? Often the question is no.

When you rent or lease anything, there's obligations stated for the authors.
But speaking about software, there's no obligations for the author what so
ever.

And how can you ignore a peace of software you'r not able to test ?

>> Please Please can I trash your piece of Rubish software....!!
>Absolutely! If it's rubbish, don't buy it...but don't FRIGGIN' use it

Source record: 183104

I've done FTP file downloading on an IBM for some time. If no fancy options are used, PC-ZIP files should be read correctly by ST-ZIP on the Atari.

The problem could be due to the fact that you've un-zipped the archive on the mainframe or didn't set the proper flags to tell the mainframe to send a binary rather than a text file, etc.

Try directly downloading the ZIPped file to your ST...

From: sytang@lamar.ColoState.EDU
Message-ID: <CtKyvo.tKp@yuma.ACNS.ColoState.EDU>
Source record: 183116

A complete hard drive subsystem ready for ST to plug and go for sale:
ICD SCSI host adapter with clock
metal case with ~100 Watt power supply and fan
external SCSI connector for daisy chain more SCSI drives (the ICD card has
one DMA out port too for other DMA device.)
Adaptec 4070 RLL - SCSI converter with two XT2190 hard drive gives ~480MB
storage space and used only 1 SCSI ID.
ALL in good working condition, drives currently partitioned as 4 with ~120MB
each and two of them in Spectre format with Mac system on it.
Asking $400 plus shipping for the whole thing.

I have Gem-Kermit Accessory which is at present the only way
that I can upload anything to my Internet Gateway (yfn)Youngstown
Freenet. The problem is that the thing was written back in 87 by
Bernhard Nebbel and made into an ACC by Ron Jeppson. It doesn't do
windows and max block size is 94bytes. This reallt defeats the
purpose of a 14.4k bps modem. REALLY dead slow, the only thing going
fast is the send and receive lights on my modem. Does any one know
of a newer, faster version of kermit that doesn't require my to
become a UNIX guru to use it! In other words, I need some kind of
shell program at the least and an Accessory that I can use with
TEDDYTerm2 like this one would be great. I think I'll as Mark Matts
if he can add Kermit support in the next Teddyterm also, just in case!
To bad mainframes don't know jekyll protocol! ;^)

it is closely related to QDOS, sinclair QLs operating system.
It seems now that they will offer it for a wide variety of
machines, expanded QLs, ATARIs, QXL(68040 card for PC) and
may be other 68k based computers.

The system is very fast multitasking and offers a GUI which
evolved on QDOS and is quite capable but also a bit difficult
to program.

Other software available is a PD ansi c compiler, lots of ported
unix/gnu texttools and probably most modern QDOS software.

Can anyone out there give me a hint, which developments might be expected from Atari in the next few years?

As I was told, they just produce the Falcon, so I am afraid that I have to change my system platform once my Mega ST has some failures as I do not like the all-in-the-keyboard design of the falcon.

My Mega ST4 works pretty good, the performance is enough for me and the programs are nice.

I am only afraid, that software developers stop developing for the Atari platform if Atari stops to produce

no, no, no!
SMS2 is only for the Atari Computers (plug in ROM), the other thing around
is SMSQ, running on QL GC, QL SGC, QXL, QVME, ATARI (according to latest
Merz info).

: The system is very fast multitasking and offers a GUI which
: evolved on QDOS and is quite capable but also a bit difficult
: to program.

That"s right, but I think programming is easier than to program OS/2
or Windowz.

: Other software available is a PD ansi c compiler, lots of ported
: unix/gnu texttools and probably most modern QDOS software.

Since I heard of SMSQ I have my doubts, if all this will run under SMS2,
but I don't know anything :-(
But nNO doubt, that ALL of Merz products WILL run under SMS2.

(shit, another thread about SMS2, must again resubscribe to comp.sys.atari)

Well I actually read through the rules sheet and I am surprised. Not least by the fact that I obviously forgot to include the updated README file that had difficultly level, abort and other instructions in it. I think that covered everything pretty comprehensively except nobody's figured out how to get the 'BS bonus' (and when we say BS we ain't talkin bonus screen). And I'm not telling either.

I do sugest that you cange this to work for a far better Zmodem program, the
XYZ thing is way way out of date....

Michael Zieglers GSZRZ is far better, has support for the extended
command line and a few other things...

GSZRZ228 a full working early version is on many FTP sites, and note its not
a TTP but a full Gem program.....

I do have a registered later version 4.7, but the great thing about this
software is that you can update it by calling a German BBS....

From the owner of a Unregistered Real Atari computer, not just a Copy...!!!!

As far as I can gather.....Atari are putting all their efforts into the Jaguar, to make it a success, before returning to computers. There is already talk of a Jaguar based computer....I don't know if this is true...but you know how rumours spread.

If you do not like the all-in-one Falcon system...you may opt for one of the many tower/seperate case and keyboard kits available. These are not too harsh on the pocket. If you want to do some hard work, then you may also build one yourself, by buying a PC tower.

Software developers will not, IMHO, stop developing for the Atari platform, as long as there are people who own the computer, and there is a huge PD market out there. Some of the best progs I've seen on the ST have been from the PD sector.

Haven't you heard of the Atari compatible computers? The Medusa...and I think, the Eagle? These are by companies that like the Atari, but are not Atari. Powerful machines.

For people changing platforms...there are ST Cards available.

IBM stopped producing PC's a long time ago...years ago.....software developers have not stopped developing for that platform, have they. The PC market thrives on the compatibles.

Anyway, have no fear for a few years at least......Atari is here to stay as long as the users are there. If you want to move onto another platform, then wait a few years, when, hopefully, parallel computing will break into the home computing market....who knows...maybe Atari will already have jumped onto the bandwaggon.

If you read (and understood) the majority of what I wrote instead of just grabbing the last few lines out of context, you may notice that I too agreed with a number of Roger's points.

When I say that, "you deserve to be ripted [sic] off," is a rationalization of theft, I don't consider it an insult particularly. If being ripped off isn't another phrase *meaning* theft, what is it? ...and dreaming up nobel-sounding excuses for screwing others always has seemed to me less honorable than the screwing itself.

And when you use MiNT you may hava a look at Lindner-TeX.
It supports long filenames on Minix-FS.

And you may want to use DVI_2.12 as a DVI-Viewer / printer to
print in landscape mode, with multiple pages on on sheet and some
nice little features, including font-libraries that save some
disk space.
And DVI is able to use printer fonts to preview your files
=> you need only on set of fonts :-)

i.e. Falcon all in one case...

This can be fixed at a small cost with (almost?) any of the keyboard replacement systems for the ST. The Falcon keyboard is pretty much just an STe keyboard with grey caps, maybe a litle nicer than STe. So if this is the only hangup just figure another $100 U.S. onto the price (with the lead value of the dollar that should be about 2 pounds ;) In the U.S. that would get you a new Mega STe keyboard and the adaptor, so I'm certain that there is an option in your country for about the same.

You're quite right and it's unfortunate. But does it justify stealing?
Do cars always work 100% correctly when they're purchased? Do
dealers/manufacturers correct all the faults for free? (Hint: Ralph
Nader, Unsafe at Any Speed)

Should we steal cars from dealers' lots and "check them out" until we
find the perfect one that doesn't exhibit some "bug" after a week of
driving? (Note: Yes, I know there are differences between stealing
software and stealing material goods...but, here, I'm just talking about
whether there's justification for the act.)

There are *LOTS* of problems with the software industry, but those
problems aren't the reason for theft; criminals who want to steal are
the reason for theft.

With regard to the copying of ST ROMs: I have much less sympathy for the copyright rights of Atari than for those of third-party developers. Why?

1. The ROMs have all had bugs of one sort or another. This is not surprising; nearly all software has bugs. However,

2. It is physically harder to install upgraded ROMs than to install upgraded disk-based software, so one would prefer another method than total replacement. However,

3. The ROMs are written in an inexcusably fascist style, making it severely impractical to patch them via RAM. (My main point, in case you couldn't tell.)

Anyone writing a ROM-based operating system, unless they have a divinely-granted privilege of writing only bug-free code, should make liberal use of jump vectors in known memory locations, so that subroutines found to be bugged can be replaced in a reasonable fashion. (And, while I'm flaming, they should NOT, on the 68000, waste the word-addressable memory range from 0000-7FFF on stuff that doesn't need to be there, especially when their C compiler is too brain-dead to generate the word-absolute addressing mode...)

I am a fairly happy used of Tos 1.0 and 1.2, but only because I have been able to craft a fix for the inexcusably awful FAT-scanning code; and I could only do that because I can install the code on the Rwabs vector. I don't know what the issues are vis-a-vis 1.60 vs 1.62, so I can't speak to the specifics of this case.

I have also heard a rumour from 'high up' in Atari UK about new
machines. Note the plural.

Also, Atari have licensed the Falcon design to one of the music
companies, so there is (or will be?) growth there.

The future isn't exactly rosy, but there *is* good hardware out there,
with more to come (although maybe not from Atari).

A \\\ A
G \\\ G
* *
-/-STR-/-STR-/-STR-/-STR-/-STR-/-STR-/-STR-/-STR-/-STR-/-STR-/-STR-/-STR-/-STR-/-
```

What would you do to promote the Jaguar? Do you have an idea that could be expressed on film? STReport wants to see it. And, we're ready to reward the person (or group) with the best idea, in picture format.

That's right, just send us a photograph of how you would promote the Jaguar! You'll also need to send us your name and address, of course.

1st Prize will be an official Atari Jaguar tee-shirt AND an official in-store promotional Jaguar banner!

2nd prize will be a Jaguar tee-shirt (identical to the one above).

3rd prize will be a "JAG RULES!" rubber stamp which is normally available exclusively from Artisan Software!

Photographs will be judged and prizes will be awarded by the Atari/Jaguar editor of STReport, Dana Jacobson.

All photographs must be received by September 20, 1994. The winners will be announced in STReport online magazine, in the issue scheduled to be released on Friday, September 23, 1994.

To be eligible, please submit a clear photograph (color preferred) of your idea. Also include your name and address with the photo! All photographs submitted will become the property of STReport; they will not be returned to you. Contest is valid in the United States and Canada only. Employees of Atari Corporation and staff members of STReport or Amiga Report are not elegible to win. This contest is void where prohibited by law.

Send your photograph, your name and address to:

Jaguar Photo Contest
STReport Online Magazine
1121 Saratoga Street
East Boston, MA 02128-1225
USA

Again, 1st prize includes a Jaguar tee-shirt and a Jaguar banner! The tee-shirt is 100% cotton. It's a black crew-neck shirt with the Atari Jaguar name on the chest. On the back is the famous Jaguar logo. The banner is the same as you've seen at your favorite Jaguar dealer. What? You haven't seen one? Well, it measures 4 feet wide and 2 feet tall! The Jaguar logo consists of those piercing yellow Jaguar eyes above the dark red Jaguar, claw marks and all! These banners are collector's items which are almost impossible to get anywhere! Rumor has it that this one may have been discovered in a rare cache somewhere in the bowels of Sunnyvale. And it can be all yours! Show it off proudly on the wall of your room or fly it out your window! All of your friends will want one, but only you will have one. It's awesome! JAG RULES!

The 2nd prize consists of the Jaguar tee-shirt, as described above. The 3rd prize is the official "JAG RULES!" rubber stamp! Use a bright red ink pad (not included) for a vivid 2.25" by 1.5" image of JAG RULES in the impact of the Jaguar logo type style. Use it as an economical way to advertise your enthusiasm of the Atari Jaguar. Stamp your letters and your envelopes. Stamp your arm as a tattoo. Stamp your money. Stamp school notebooks and post-its. Writing a letter to your favorite software company? Stamp it! Sending a birthday card to your best friend? Stamp it! Dropping a postcard to your brother at school? Stamp it! Let everyone know you're a Jaguar gamer. After all, in the empire of high technology entertainment systems, JAG RULES!

For an example of the JAG RULES logo, call the CATscan BBS. Dial 209/239-1552. Download file: JAGRULES.ZIP. File is ZIP'd and requires PKUNZIP to decompress. Or, call your favorite online service to find it!

Need a tip to help you start thinking of some ideas? Drop us a line in E-Mail to either DPJ on Delphi, 71051,3327 on Compuserve, D.JACOBSON2 on GEnie, or Internet mail at dpj@delphi.com. Or, call us at Toad Hall BBS at (617)567-8642 and leave a private message to Dana Jacobson.

Are you still here? Grab that camera and start taking some pictures! One of them may just be the winner!

Credits: STReport and its staff would like to thank Atari Corporation for its generous donation of the banner and tee-shirts.

==========
Tradenames herein are trademarks or registered trademarks of their owning companies.

Permission hereby granted to re-post this contest text, in its entirety, anywhere that you feel it would be appropriate - your favorite BBS,

user group newsletter, magazine, etc. Please spread the word!

>
> *Mostly*, the people who steal software wouldn't buy it anyway...they're
>too cheap.

Or just basically dishonest in the first place. But there is another group of people who would really prefer to do the 'right' thing but when faced with the temptation of free software they find it hard to resist. So they frequently accept the pirated software and use it under the rationalization that they will probably buy a legit copy sometime soon anyway. More often than not, that time never comes, however. It's _this_ group of users that make up the majority of lost revenue in potential sales.

>The companies that claim they're losing a mint to piracy are just
>pulling numbers out of thin air to make a big case and impress the law
>makers/enforcers.

I won't dispute that some outfits make far too big a deal out of this and their statistics are likely questionable. But by and large, there _is_ no enforcement of the law. Education seems to me to be the best tactic.

>Even if they could shut down every one of the warez dweebz, it wouldn't add
>a cent to their profits.

I disagree. Those 'warez' have the tendency of eventually floating down to the average-usually-honest-man-on-the-street who WOULD buy the software if it were not available illegally.

>(On the other hand, focussing on corporate-level theft *might* get them a
>few extra dollars...but not those in the Atari software business.)

Sad, but true. <sigh>

>Can anyone out there give me a hint, which developments might be
>expected from Atari in the next few years?

As most folks will tell you, the future of Atari lies solely with the Jaguar game system. Atari has 'put all their eggs in one basket,' so to speak, and the success of failure of the Jaguar will tell the tale. That's just IMHO, of course, but I think it's also the majority opinion.

Some believe that very successful Jaguar sales will eventually lead to new and improved desktop computers from Atari. I, for one, am not that optimistic, judging from 'inside' information and public announcements and innuendos from Atari themselves at various stockholders meetings.

But be that as it may, if the Jaguar fails miserably, you can bet that Atari as we know it will likely collapse as well. It seems a cruel twist of fate to me that I should buy a GAME system to help insure the continued existence of a great desktop computer! It's a cruel world, indeed. :)

>I am only afraid, that software developers stop developing for the Atari
>platform if Atari stops to produce

By and large, this is _already_ the case. Software developers must also eat (albeit grudgingly) and many have found greener pastures elsewhere. It's rather like a chicken-and-the-egg dilemna... no hardware=no software and vice-versa as well.

But hey, even if Atari Corporation folds that does NOT mean the end of Atari computing! We can still enjoy these great machines for a long time to come. The 8-bitters have been without any real support for years but they still have a lot of fun, regardless. I reckon we could too. :)

From: rshuster@netaxs.com
Message-ID: <3169ir$m7h@netaxs.com>
Source record: 183055

I still have few Atari items left for sale - make me an offer.

Atari SF314 DS 3 1/2" floppy drive - mint condition, only used by me for Spectre GCR use for a very short time - in the box with all materials, etc.

EABrown Multisync switch box - I used this with an NEC Multisync II. Get low, medium, and high resolution on one monitor.

My wife works at a Catholic Home for Boys where they have two Atari ST systems that they are thinking of selling. One is a Mega 4 ST with an IBM emulator board built-in (not sure which one), ICD host adapter, and SC1224 color monitor, along with associated sw. They want to keep the hard drive. The other system is a 520 ST with an SM124 monochrome monitor and I believe one external drive (homebrew TEAC mechanism in a PC case.) Anyone interested? Reply via Email or voice since I rarely visit this group. Thanx - Bob Shuster - Copywerks/Musikwerks - 215-927-4928 (Philadelphia)

Hehe, I just got my hands on the 1993 Atari annual report and thought
I'd share the "wealth" of information with the people who have been
blindly trusting in Atari to "keep hope alive". The following shows
how a sufficiently incompetent group of managers can successfully
run a profitable corporation into the ground. To wit:

Brief Financial Summary
Figures in US$ thousands
1991 1992 1993 3 year change
---- ---- ---- -------------
Net sales 257,992 127,340 28,805 -88.4%
Operating expenses 276,675 206,348 76,304 -72.4%
Operating Income(loss) (18,683) (79,008) (47,499) -154.2%
Net Income(loss) 25,619 (73,615) (48,866) -290.7%
Shareholder Equity 125,529 50,583 4,354 -96.5%
Advertising Expense 20,129 11,325 3,282 -83.7%
Research & Development 15,333 9,171 4,876 -68.2%

Here's an interesting tidbit from the back of the report:

Amounts receivable from related parties and underwrites, promoters
and employees other than related parties (people who owe Atari money)

Year ended 12/31/93

Name,title Current Balance Non-current
---------- -------------- -----------
August Liguori, Chief Financial Officer $76,000 0
Richard Miller, VP - Technology $145,000 0
Alwin Stumpf, ??? $217,000 $143,000 (!)

And now, for all the cheerleaders who said I was crazy when I said several
years ago that Atari was not competitive in the computer market and should
refocus their resources on what they were "good" at (consumer electronics).
Here are some relevant quotes from the report:

P.6 Since introduction in the first quarter of 1993, the Company has
shipped small quantities of this product [Atari Falcon]. The
company does not expect sales of this product to be material in
the future.

P.7 The Company's ability to compete, within its industries, depends,
in large measure, on its ability to adapt to the rapid technological
changes, including hardware system, related software, and peripheral
products. In this regard, the Company is committed to an ongoing
program of research and development, focused primarily on the Jaguar
product line. [my comment: looks like Atari computer owners are SOL.]

P.10 No assurance can be given that the Company will have the financial and other resources or the ability to maintain the technological knowledge and innovation necessary to continue successful competition in these [personal computer] markets. [SOL]

P.13 In 1993, substantially all research and development expenses related to the Jaguar product line. [SOL]

The capper:

P.13 Due to intense competition from larger competitors and shrinking margins in computer products, the Company **decided** [emphasis mine] to exit this line of products and to refocus itself as an interactive media entertainment company. [last nail in the coffin]

[Note: This is rather striking since 67% of 1993 sales were computer products and only 13% was attributed to Jaguar sales.]

Happy reading!

Regards,

Chris

P.S. I wonder if the Tramiels' net worth also declined by 96.5%? Not.

To the best of our knowledge, (and we were the ones who were going to distribute/register future version of FzDT...) FzDT appears to be a dead program. We haven't heard anything from Aaron in several months. Apparently, his other programming job pays so well that he can't justify spending time to work on FzDT (which doesn't hold the same financial potential).

1318. ANSITerm 1.91 Features

Newsgroup: comp.sys.atari.st
Date: 1994-07-27 21:18:08 UTC
From: millert@grad.csee.usf.edu
Message-ID: <316iug$407@mother.usf.edu>
Source record: 183059

ANSITerm 1.91 UPDATE
What's new to ANSITerm.

This text file describes what features have been added in ANSITerm 1.91, which is the upgrade to ANSITerm 1.90. You may distribute this features-list freely. The information below is taken directly from the documentation for ANSITerm, and is therefore instructional, as well as descriptive.

Note: Some features like Break, Hang-up, Connect-Log, and a few others that access RS-232 control lines do not work properly on the Falcon, but everything else does.

ANSITerm 1.91 is the REGISTERED version of ANSITerm, and the registration fee is $15. Mailing address given at the end of this document.

AUTO-LOGON MACROS

The autodialer macros (F1-F3) have been modified to allow you to program ANSITerm to automatically log on to a BBS. Three special characters can be inserted into the macro (by pressing the corresponding function key):
F10 - One second pause (not new to ANSITerm)
F9 - Marker
F8 - Link

When there are no Markers (F9) in a dialer macro, ANSITerm treats it like normal, but if an F9 appears as the first character, then when ANSITerm comes to that macro it will search for the string between that marker and the next marker it finds. It will then respond by transmitting what follows the second
marker.

For example, if the login prompt of a BBS were "Enter user name: ", and you wanted ANSITerm to respond with "Timothy Miller<CR>", then the macro would be entered as "<F9>Enter user name: <F9>Timothy Miller<CR>", where <F9> means to press the F9 key and <CR> means to press the ENTER key (not RETURN).

When you first connect, ANSITerm starts with the first of the three dialer macros (F1-F3) it finds that has an F9 as the first character. As it finds and responds to each one, it goes to the next IN ORDER from F1 to F3, then stops looking.

If there is a "look for" string in a dialer macro and you press that function key to transmit the macro, all characters between the markers will be skipped. In the above example, pressing F1 (if that it where you put the macro) would cause it to send only "Timothy Miller<CR>".

The number of the string that is being searched for will be displayed in place of the decimal point in 'ANSITerm 1.91' in the upper right corner of your screen. I don't know how much ANSITerm is slowed down by the search, and I have given no provision to stop the search. If you find that, after ANSITerm has logged in for you, the decimal point does not reappear, then you know that you did not setup the auto-logon macros correctly.

LINKED MACROS

ANSITerm also now has the ability to link macros together so that they transmit as one long macro. Linking actually inserts one macro into the calling macro so that the calling macro continues where it left off after the one it called is finished. To link, you would press the F8 key, followed by one of the following characters:

1 to 9 - Shift-F1 to Shift-F9 macros (respectively)
A - Shift-F10 macro
X, Y, Z - F1, F2, and F3 dialer macros (respectively)

As an example, one might have a multi-line message tag that they like to append to messages on a BBS. Here is an example of such a tag:

------------- Timothy Miller
------ Two Worlds Publishing
-- Processor Direct Magazine

This macro could be entered as:

(into Shift-F6), "------------- Timothy Miller<CR><F8>7"
(into Shift-F7), "------ Two Worlds Publishing<CR><F8>8"
(into Shift-F8), "-- Processor Direct Magazine<CR>"

There are other things that one could to, such as putting a commonly used handle into, say, Shift-F9, and then placing <F8>9 into all of your auto-logon macros that would need to send that handle.

Some notes: Link and One second pause only work for TRANSMITTING. You cannot link a macro into the "look for" portion of an auto-logon macro. Also, one sure way to crash ANSITerm is to link a macro to itself, whether directly, or in a loop with others. This can cause serious problems.

FAST SCROLL

If you use a high-speed modem, you may have noticed that ANSITerm scrolls a bit slowly (compared to an MS-DOS based terminal program). In my never-ending desire to improve ANSITerm's speed, I have developed a novel TRICK to make ANSITerm scroll many times faster, as long as the top and bottom margins are at their normal positions (lines 1 and 24). You will notice, however, that due to the trick, a copy of the menu bar will flicker faintly on the line just below its normal position while scrolling. This is a small price to pay for such a drastic improvement in speed.
If you don't like the flicker, this option can be turned on and off from the Optn menu.

CONNECT TIME

ANSITerm can now log your calls for you. When you click on the Bufr menu, you will see "Connect Time" at the bottom. When you click on this, you will see |Off|File|Buffer|. These will allow you to:

Off - Turn off call logging
File - Put connect and disconnect notices into a file
Buffer - Append all connect and disconnect messages to the capture buffer

BREAK SIGNAL

Pressing Alternate-B will now transmit a BREAK signal.

END OF LINE WRAP
A minor modification has been made to ANSITerm to make it more compatible with UNIX. Originally, when the cursor was at column 80 and another character was received, the character would be placed in column 80, and the cursor would jump down to the next line. In this version of ANSITerm, the character is placed in column 80, but the cursor stays there unless another character is received. Then the character will be placed in column 1 and the cursor in column 2. In most cases, this is not noticable, and it has essentially no effect on how text is displayed on the screen, but the change allows you to use the VI editor properly without having to have end of line wrap turned off, since many UNIX programs require that you have end of line wrap turned on.

WHERE YOU CAN CONTACT ME
The GEnie address given in the documentation for ANSITerm 1.90 is no longer valid. You can now reach me at the following addresses:

P-DIRECT2 - GEnie
millert@grad.csee.usf.edu - Internet

US Mail:
Timothy Miller
Two Worlds Publishing
7519 Winging Way Drive
Tampa, FL 33615-1519

For anyone who wants a copy of ANSITerm 1.91, they can send me a registration fee at the above mailing address after their 30 day trial period for ANSITerm 1.90 or earlier.

>or task switching at least, system running. I thought about MiNT, but after

I use MagiC 2.00 (the new name for Mag!X) on my 4MB STe. There will also
be a new version for the Falcon within the next months. It is not as
"unix-like" as MiNT (and it still does not offer signal-handling and
extended file-structure of MiNT) - but i think for a slow 68000-machine
MagiC is the best choice. You will notice, that MagiC is faster than a
single-tasking-TOS and really _much_ faster than MiNT or MultiTOS!

MagiC is a _full_ replacement of the TOS - including BIOS, XBIOS,
GEMDOS and AES, VDI based on the KAOS-TOS (do you remember ... ?).
(MiNT is only a replacement for the GEMDOS and it's very dependend of
your build-in TOS). This means there are many bugs of older TOS-version
fixed (serial port handling etc.).

You will get pre-emptive multitasking for TOS-programs and also for
GEM-applications. You will get most of the extensions of the
MultiTOS-AES (64 GEM-windows, windows can be handled in background etc.).
You can configure the time-slices for task-switching, you can also use
cooperative task-switching and you can start programs in "single-mode",
where all other tasks will be "frozen". You can use MagiCDesk, Ease or
Gemini as desktop program.

I didn't have any problems with any program - there are just some old
GEM-applications and games :) wich have to be used in "single-mode" ...
... but they also work fine.

I hope this helps you ...

Why would Atari computer _owners_ be SOL? Perhaps _buyers_, but not owners. The minute Atari made this decision, my MSTE stopped running - NOT! Anyway, be proud of yourself for taking the time to compose a bandwidth wasteful post stating the obvious, stating what has publically said by Atari officials for months, and something 99.9% of anybody with a least interest in Atari computers has know for quite a while.

Which means, when i buy a peace of software which contains bug's, i pay for
the bug's as well ? What kind of rubbish is that.

If you go out and buy a new car, and find it not working as it's suppose
to, will you pay for it ? I guess not, or at least you'll demand the dealer
fixing the problem, without having to pay for updates, right.
This goes for almost everything, except software.

>If you wrote a program. Would you want someone to go in and modify its
>code? And if they did, and then it erased someone's hard disk, would you
>want them to sue you (over a change you didn't even do)? See how these

If the company asked the consultant to modify the software, then it's the
company responsible too see it done correctly.

>See above. Most developers (especially Atari developers) are pretty poor.
>Just the legal costs for a lawsuit (even if they didn't lose it) would

>happening), but you never know. If someone is too lazy to back up their
>hard disk, then drags the drive to the trashcan by accident, should they
>be able to sue us?

I don't think this issue is about illegal copies or piracy. It's more about
the question of developing software which isn't working, and asking money for
this.

That's why you buy from a reputable developer and/or dealer. We've always
stood behind every product we sold, even if that cost us more money than
the customer paid in the first place.

> Second, you can get a software which do some damage on your equipment, (like

Problem is that most people don't register shareware. A simple fact, but
it creates a very harsh reality.

Hi there

A friend of mine is still looking for a hi-res B&W monitor for his 1040STE.

All reasonable offers considered!

Call: Martin on (07) 357-7194 (after hours)

or reply to this mail.

Murray

I have the Demo of Freeze Dried Terminal which I like. However it is pretty useless for logging onto VT100 machines. Does anyone know if there is a patch to do VT100 on FZT???

Or maybe a ZMODEM program for use with Interlink.

Shane Kenyon

New version should be available in a week or so. The Invaderball bug might be fixed, and certainly all the hard drive problems are, and there will be the option to plug in extra sampled FX on STe TT and Falcon.

If you're running it from a hard drive that might be the problem. If not try holding ALT and CTRL as soon as you double click on it. Try it from a clean floppy with ALT and CTRL held down, that should make it work on just about everything.

Is MagiC compatible with NeoDesk? IF the latter corresponds to published programming guides and API, and if it works with MultiTOS and TOS, then any problems with MagiC must be MagiC's fault. MagiC should emulate the standard API.

I thought MEgamax went belly up several years ago. I don't think anyone bought
the rights to the C compiler.

>Merz info).

What I deduced from their latest info in the QUASAR is that they
want to merge SMSQ and SMS2 to one system. This is suposedly more
QDOS compatible then plain SMS2 and should be the (almost) the same
for GC,SGC,QXL, ATARI and potentially any 68k machine.

#+speculation-on
I believe SMS2 won't be sold separately any more
#-speculation-off

Did Atari ever release their transputer addon for the ST series. I believe they were talking about it 3 years ago. It had a target price of 600 pounds sterling and could be fitted with up to 4 transputers.

1343. Re: Transputer Addon

Newsgroup: comp.sys.atari.st

Source record: 182929

The released in limited numbers the full blown Transputer Workstationm, ATW, Abaq whatever it was finally called. Kuma(?) also released a one transputer box that could be attached to the ST and programmed. I don't believe the Kuma device is still available though.

Yes, there is MPEGPLAY.TTP available on atari.archive.umich.edu
in, I would THINK, the atari/Falcon/Graphics directory. It doesn't
use the DSP, so it only gets about 1fps using the 16MHz 68030.

No. Although I believe Atari U.K. did some 'preliminary' R&D on
the STT, I think they gave up on it fairly quickly.

A point I hadn't considered....

To be more specific then, when companies, and groups such as SPA,
publish statements such as, "We estimate that there are [x*100000]
pirated copies of product [Y] in the world, each with a retail value of
$499.95. Therefore we've lost [x*100000*499.95] dollars of revenue to
piracy," the lack of logic annoys me. Something in the back of my mind
says, "these weasels are trying to make a case for royalties on blank
diskettes!"

I can always hope that their code makes more sense than their press
announcements.

1352. Copyright Laws...!!

Newsgroup: comp.sys.atari.st
Date: 1994-07-28 11:56:45 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <3186dt$plm@golem.wcc.govt.nz>
Source record: 183087
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

A few Points I would like to mention about Copyright and the Laws in New Zealand...

Some of the USA shrinkrap software Licence agreements can no be enforced here in N.Z, they are just no Legal...

A person that has a Legal copy of TOS 1.6 is entitled to a full working copy (TOS 1.62) with out the Bugs, by any means possible, that does mean getting a copy of these ROMs, on this point the Law is on his side..

This person should not have to buy ROMS at all, also TOS 2.06 ROMs have problems with a lot of Software, to suggest that this person has to get the Software upgraded, get real, most of these software houses no longer exist, how do I update my Copy of Script...?

Also to suggest that you can't alter Copyrighted software, gee look at all the patch programs for TOS, like KAOS TOS 1.4, did Atari shut them down, no, as it does not have a case....

A friend of mine a few years back brought a copy from the USA the Atari Wordperfect, as it was much cheaper than here, some time later he heard about a update and send his warranty card back to Wordperfect, some months later he received a letter from the agents here, asking some $600nz for New Zealand registration, this was more than he paid for it in the first place, he asked the agents here what he would be getting for his $600, they could not tell him...

Since then Wordperfect Corp has instructed there agent here to have every imported copy of Wordperfect to be confiscated by customs here, as they hold the Copyrights.....

The same has happened to Apple computer imports, the import agent holds the Copyrights...

The Problems with all this is that most USA PC software is some 5 times the USA Price, this is also correct for the new Power Macs..

Current exchange rate = 1.66 times the USA $

A person time time back wrote a article in a New Zealand Mag and refered the software importer/agents as Pirates here, as there high prices = theft...

One of the Big problems here is schools, they copy any thing they can get, if a school has 10 PC computers in can't afford to get 10

copies of ther software, they just don't have the money, and the government here does not help at all...

Please Please don't get me wrong I have more brought pieces of software then most of you on this net, I wonder how many of you that has a illegal copy of some piece of software...

Own up those that have illegal copies of UIS III..

And NOTE: I have been asked for copies of Neodesk many time, even last week..

As the Bible states, those with out sin can cast the first stone...

So why not try and be honest with your self ...!!

From a owner a a Rwal Atari computer, nou one of those Copies that I keep hearing about....

Unfortunately, I understand that current MagiC versions are not too
good in this respect, although the authors are apparently working to
make it better. For me, this is one good reason not to run MagiC.

Can any MagiC users post any programming experience? Like, how do you
check for certain things like available AES functions.

You make it sound like bug's are intentional. If you buy a book and the
author has a confusing and grammatically incorrect sentence in page 232,
do you demand that the author fix the sentence and send you a new book?
This, again, goes into the whole issue about buying software from a
reputable developer. As our users know, we've gove out of our way to fix
any and all bugs in our software and making these available through
downloadable patches.

> If you go out and buy a new car, and find it not working as it's suppose
> to, will you pay for it ? I guess not, or at least you'll demand the dealer
> fixing the problem, without having to pay for updates, right.
> This goes for almost everything, except software.

First of all, most software from reputable developers works. So this
example doesn't even happen. The issue is if you find a bug. We've always
jumped right in to fix our bugs. However, we still feel we have to print
a disclaimer, this is necessary because of the legal climate in the U.S.

> If the company asked the consultant to modify the software, then it's the
> company responsible too see it done correctly.

Hmmm. Obviously you are not aware with the way liability lawsuits work
here in the U.S. The more correct answer is "if the company can convince
a jury that the developer should have found a way to prevent tampering,
they can find the developer negligent and ask for damages (money)".

> I don't think this issue is about illegal copies or piracy. It's more about
> the question of developing software which isn't working, and asking money for
> this.

We've never done this. We don't plan to start, either.

Sorry to post one of these really annoying postings but IT IS
IMPORTANT!!!!!

Please, please, please, can anyone that i've had contact with just drop
me a quick line with your address.

My pain in the arse systems manager has just wiped my email account
completely so I no longer have anyone's address.

This is much appreciated!!!!

Thanks again, Steven.

Not being a member of the SPA I haven't really paid attention to their statements. However, I wasn't aware that any Atari developers were members of the SPA. So their figures (however innacurate) don't really apply to our market. Trust me, if I was selling 1,000 copies a month of a program on the PC market, I would not be as concerned about piracy. I could at least then maybe afford a vacation once in a while. The Atari market is unique because if we lose 10 sales, it might make the difference that month if we can meet our payroll!

I'm not sure if any of these are on any Ftp sites, but you should look for:
BinkleyST (mailer)
Semper (mailer)
Led (mail-reader)
IOSmail (mail-tosser)

Greets

>

Says who ??

A little story from the real world.
A company here in Denmark got the permission to translate Tos 2.06 to
danish. In fact they got the permisson to do whatever they wanted with
the Tos, just as long Atari Co. isn't responsible for anything around it.
Now they'r translating the German Tos 2.06 to danish and sell it. They havn't
got any licens to do it, they were just told by atari Co. that they really
didn't care at all about their Tos.

Maybe this is illegal, but it sure did help that many people bought this
Tos.

They were not the TT clones. My source is well placed in the UK commercial scene, and heard it personally from (etc). Of course, I'm as sceptical as the next man, and will believe it when I see it. Thought it was worth mentioning at any rate.

>>Also, Atari have licensed the Falcon design to one of the music

>their products rather than their competitors' products mostly because of
>it. Early this year, Borland brought out a remarkably stupid licensing
>policy for one of their compilers; CompuServe users flamed it to cinders
>and Borland backed off.)

Yes, but when a peace of software is tested, it's often not tested with all
Tos's, (and we do have a few), and because of that there may be troubles
with some but not all. Often when a program bombs, it's due to other applcations
running at the same time.. Who's there to blame now ?
No matter how you twist it, the cuctumors are the losers.

>By letting it sit on the seller's shelf?

But the seller doesn't have it either. You can order it by mail-order, but
you'r not able to test it. And also you might end up in the same situation
as i just descriped above.

>Demo versions, magazine reviews, the Internet, friends and co-workers,
>in-store demonstrations.... I certainly realize that there's not as
>much information for those of us in the Atari world, but we knew that
>going in, right?
>

Yes, there are many options, but:
1. a test in a magazine doesn't cover all of it.
2. Internet, well could come in hand as well as our other networks, but this
isn't good enough. You'r testing the software on another equipment.
3. Friends and co-workers is probably the best methode, borrow the software
from a friend, and now you can test it.
4. in-store demostrations, not such an good idea. Those guy's are after your
money, and often don't know enough about the software themself.

Here in Denmark we got two stores left, and one of which doesn't have any
machines any longer. Am i to travell through the country, just to test some
piece of software, and probably find it not working the way it's suppose to
?

>You're quite right and it's unfortunate. But does it justify stealing?

No ofcouse not. But let's invistigate this abit. Who's the one stealing ?
I'm the custumor who just bought a piece of software, and find it not
working. Now i want my money back, but can't have it due to the chance
that i have bought the software to crack it.
I'll ask you again, who's the one stealing ?

>Do cars always work 100% correctly when they're purchased? Do
>dealers/manufacturers correct all the faults for free? (Hint: Ralph
>Nader, Unsafe at Any Speed)

No cars doesn't always work, but then you have at least 1 year guarantee
and the problems is fix'd by the dealers.
This is something you can't say about software.

>
>Should we steal cars from dealers' lots and "check them out" until we
>find the perfect one that doesn't exhibit some "bug" after a week of
>driving? (Note: Yes, I know there are differences between stealing
>software and stealing material goods...but, here, I'm just talking about
>whether there's justification for the act.)

No, and you'r wrong. When buying a car, you get the chance to test it.
Also you have the guarantee i just mention above.

>
>There are *LOTS* of problems with the software industry, but those
>problems aren't the reason for theft; criminals who want to steal are
>the reason for theft.

The main reason I don't have MagiC is that it doesn't support the Falcon.

>Can any MagiC users post any programming experience? Like, how do you
>check for certain things like available AES functions.
Normally, you would check for AES version. If the AES version supports
appl_getinfo, then you check there too. One problem is that MagiC returned
3.99 as the AES version, so people expected all of the 3.30 and 3.40 AES
functions to be supported. There is now a patch (not to correct MagiC,
but to make it return 3.[23?]9 instead of 3.99!).

I'm sure it will be very nice when it's finished. I have been told
(can't remember the source, sorry) that the authors are not working on it
at all now, but are doing NVDI updates instead.

As far as I know both of these (Lindner-TeX and DVI_2.12) are
only in German. TeX is complex enough as it is let alone
having no documentation that you can read. I use CS-TeX
but I have Lindner TeX sitting on some floppies until the
day I can find someone (or have time myself) to set it up.

DVI_2.12 looks pretty good but I haven't managed to get it working.
I can't read the docs and I get some sort of error messages
that I can't read either. It's too bad because I would GLADLY
pay shareware fees for programs of this calibre if I could
actually use them.

The same goes for Gemini - v1.999 looks excellent but either
it has some minor bugs or I just haven't set it up right. Again,
without documentation you can spend a lot of time and get nowhere.

Perhaps not that different...they make more sales; they "lose" more
sales; they have a bigger payroll.

It all comes down to (for the point I was trying to get at) whether you
count one pirated copy of a program as one lost sale. I think that the
people who support that equation are either fooling themselves or have a
hidden (almost) agenda.

If you had some way of knowing that you were being paid for all the
copies that anyone would be willing to buy no matter whether they were
able to steal copies or not, would you still want to stamp out software
theft?

(Personally, I vote yes...not because it makes good business sense, but
because I don't like having a thief think he's made a mark out of me.)

If you purchase your software from a reputable developer and you discover real bugs (features that are supposed to work but do not), the developer will either refund your money or fix the bugs. That is not rubbish... it's called customer support.

>I don't think this issue is about illegal copies or piracy. It's more about
>the question of developing software which isn't working, and asking money for
>this.

I don't know what you mean by 'this issue' as the original thread DID start out by talking about software piracy (specifically the theft of ROM code).

If you buy software that works but doesn't include features you would like to see, this does not make it buggy software. On the other hand, if a dev sells software that does not work as advertised then obviously this is wrong. But you make it sound as if every single software developer in the world is guilty of this and THAT my friend _is_ rubbish.

I too have often wondered about the validity of their statistics. But
the point is, who knows how much potential revenue is _actually_ lost?
From that perspective, their guess is as good as the next guy's.

>Something in the back of my mind says, "these weasels are trying to make
>a case for royalties on blank diskettes!"

Weasels??? Gee, a bit harsh, eh mate? After all, THEY are not the ones
committing any crimes (unless you consider gross exaggeration a crime).

>I can always hope that their code makes more sense than their press
>announcements.

Er... remember that SPA is only a representative organization; a lobbying
group if you will (like the IAAD). SPA doesn't produce any code. To my
knowledge, no Atari developers are SPA members because the membership
fees are outrageously expensive... several thousand $$$ per year, AFAIK.

Oh, and just which license agreements are not legal in NZ, Roger?
Give us some specifics.

>A person that has a Legal copy of TOS 1.6 is entitled to a full
>working copy (TOS 1.62) with out the Bugs, by any means possible,

ANY means possible? Rather far-reaching powers aren't they?

>This person should not have to buy ROMS at all, also TOS 2.06 ROMs
>have problems with a lot of Software,

Very few incompatabilities in my experience.

>to suggest that this person
>has to get the Software upgraded, get real, most of these software
>houses no longer exist, how do I update my Copy of Script...?

I don't know, but is that Atari's fault? Well, actually it might be. :)
The point is does that legally entitle you to steal Atari's s/w?

>Also to suggest that you can't alter Copyrighted software, gee look
>at all the patch programs for TOS, like KAOS TOS 1.4

No, no, no, Roger, you missed the point entirely. Developers don't
want you changing their copyrighted software, mucking it up, and
then claiming that THEIR software is defective. That's the issue.

[...]

>Since then Wordperfect Corp has instructed there agent here to
>have every imported copy of Wordperfect to be confiscated by
>customs here, as they hold the Copyrights.....

Bum deal, but this has nothing to do with copyrights at all.

>The same has happened to Apple computer imports, the import
>agent holds the Copyrights...

No, the import agent may hold the 'distribution rights' to a specific
geographical area, but that's not the same as copyrights.

>The Problems with all this is that most USA PC software is some 5
>times the USA Price, this is also correct for the new Power Macs..

I'm aware of this having lived in Oz for a few years. Another bum
deal, but what's your point? This does NOT justify piracy!

>One of the Big problems here is schools, they copy any thing [...]

Again, what's your point? Does that make it OK for YOU to steal?

>Please Please don't get me wrong I have more brought pieces of
>software then most of you on this net,

Hmmmm... in consideration of your comments over the past few days,
somehow I find that very difficult to believe. ;-)

>And NOTE: I have been asked for copies of Neodesk many time, even
>last week..

And I'm sure your friends are grateful for the copies you gave them. :)

>I wonder how many of you that has a illegal copy of some piece of software...
>Own up those that have illegal copies of UIS III..
>So why not try and be honest with your self ...!!

Why is it that software pirates always seem to think that _everyone_
else in the world steals software too? AFAIK, I have no copies of
pirated software and the little shareware software I use is registered.
And yes, I have a copy of UIS III (great s/w)... bought from ST Informer
at a Glendale show ages ago and upgraded many times over the years.

Roger, this is getting silly <again>. The whole point is that you
advocated the theft of copyrighted software and admitted to owning
illegal TOS ROMs yourself. To make matters worse, you flamed others
for trying to educate the original poster about right vs wrong. This
does not do much for your public image, mate. ;-)

Do what you will in the privacy of your own home. But do us all a
favor by not publicly promoting _any_ form of software piracy. When
you do so that's just like rubbing all developers' noses in the dirt
and hey... after awhile that hurts! :)

"What goes around, comes around."

Well, I know when I was playing around with programming with GDOS loaded, my VDI routines defaulted to a virtual 32000 x 32000 screen size, thus all grpahics which tried to draw to a 640 x 400 screen were scrunched in the corner. I don't know TDM or how it was oprogrammed, but maybe this is the case??

~Chris
> Apart from rebooting without GDOS, any tips?

1374. what's with comp.sys.atari.announce

Newsgroup: comp.sys.atari.st
Date: 1994-07-28 15:39:10 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <318jeu$2ni@usenet.INS.CWRU.Edu>
Source record: 183006

What's with comp.sys.atari.announce???

Any postings that are put up there are deleted in less than a week.

Shouldn't there be a minimum of two weeks?

The postings just placed up there will probably only last a few days and
I don't see any new postings be approved.

Just wondering if the moderator of that area is still alive.

Len

|> I'll ask you again, who's the one stealing ?
Why would you buy software to crack? You buy it to use surely? I'm sure the last reason on the mind of the shop/developers when you try to get a refund is 'Oh, I bet he cracked it first'.

I don't think there is a single piece of software I have bought, that I didn't get knowing full well it's abilities and/or shortcomings. That's what thenet, magazines, friends etc are for. If you go and buy a 300GBP DTP package that you have no knowledge about, for instance, you only have yourself to blame IMHO if it doesn;t do what you want.

At some point the registered users of Laser C were offered to upgrade to
Pure C by Applications Systems. Laser C is no longer supported. We, at
Gribnif Software, handle Pure C in the U.S. for Application Systems now.

>committing any crimes (unless you consider gross exaggeration a crime).
I didn't accuse them of any crime. If I had, I'd have use the word
"criminals" instead of "weasels." :-)
More seriously, I often find myself more irate at sneaks than at
thieves -- not that I'm a real fan of either one. I don't like those
who set snares for the unwary, who are *overly* opportunistic in looking
for loopholes, who rely on the letter of unfair laws, who disclaim
responsibility while reaping benefits, or who otherwise compare
unfavorably to snake-oil sales-critters.

No, I don't think it's harsh, if true. (And, of course, you only have
to look as far as audio and video tape to find real-world examples where
companies and organizations have argued that they deserve compensation
for losses they can't substantiate.)

>>I can always hope that their code makes more sense than their press
>>announcements.

>SPA doesn't produce any code.
Understood. Though perhaps unclearly, I did include [software]
companies with SPA in the message quoted above.

Actually, I was recommending listening to their recommendations and
experiences rather than "borrowing" <ya, right> it.

>4. in-store demostrations, not such an good idea. Those guy's are after your
>money, and often don't know enough about the software themself.
All of this may be true, but your point's still not coming through. Are
you looking for perfect safety? (You're not going to get it...not
legally, but that's also true for lots of other products that *can't* be
stolen as easily as software.) Do you think that *every* store and
vendor are out to defraud you? (They're not and all of my suggestions
that you found fault with can help you pick out the good ones.) Or are
you just looking for someone to agree that the Atari market, computers
in general, and all of life is basically unfair? (OK, I agree. :-))

I realize that one incident isn't proof of anything, but....

I have an old PClone with a MIDI card as well as an Atari. A few years
ago, a relative gave me a Xmas present of the PC version of
Band-in-a-Box by PG Music. It didn't work with my system -- normal PC
interrupt conflicts, I believe. I called the company and they had no
technical answer and advised I return it to the store. I figured that
would be a pain and mentioned how these problems didn't happen on the
Atari. The person on the phone asked whether I'd rather have a copy of
the Atari version of the program than a refund. I said yes and it was
at my house in a week. We both won: I have a good, working program and
he has a customer who pays for enhanced versions of BiaB.

My point, here, is that many programmers and software suppliers are
human. :-) They don't get many extra points (or dollars) for making
people angry and building a bad reputation.

From: fusiong@STD.teradyne.com
Message-ID: <9407281838.AA00276@std.teradyne.com>
Source record: 183023

44MB Syquest Drive. Custom built by Carter Graphics. Has
DMA port for Atari use. Has 50-pin Centronics SCSI port for Mac
use. Switch switches between the two. Works pefectly.
Used sparingly. Includes ICD host adapter and cable for
Atari use.

$400 or best offer. No cartridge.

Costs extra because it includes the ICD Host adapter card
and cable that allows the unit to connect to the Atari all in one
box. Perfect for Gadgets users.

>that i have bought the software to crack it.
>I'll ask you again, who's the one stealing ?
Since I haven't had anyone *ever* refuse a refund for that reason, I find it difficult to answer your question. (I usually avoid signs that say, "All Sales Final," as if they were covered with poison.) On the other hand, when I see someone running a program with no disks or docs, I have a reasonably large hint about who's the one stealing.

>No cars doesn't always work, but then you have at least 1 year guarantee
>and the problems is fix'd by the dealers.
>This is something you can't say about software.
It's also something you can't always say about cars. I believe it was Nader's book that told about someone buying a car and having so much trouble getting it fixed under warranty that, in frustration, they took it to the manufacturer's office building and burned it on the front lawn. More commonly, the dealer tinker's enough to keep it running and then hits you for the parts replacement bill the day after the warranty expires. :-)
(The smiley face above is because I don't have a car; I just recite the horror stories that my co-workers tell me.)

>I don't like to call it theft. I would rather call it borrow to test.
You've already said that you think people should pay for software if they use it, but a lot of people who "borrow" software are not like you--otherwise we wouldn't be in this thread. Unfortunately, those people don't like to call it theft either; it's too harsh...too criminal.

As you've described it, of course it's not illegal as they _do_ have a
'license' from Atari to translate it and sell it, even if that license
(aka, permission) was only granted verbally, it's still binding.

That's a completely different situation from some outfit just copying
the ROMs and selling them independently of any authorization from Atari!

Yeh, life is tough sometimes, isn't it? Still no excuse for theft. Sorry.

>I don't like to call it theft. I would rather call it borrow to test.

Yeh, right. We've heard it all before, Kim. It's still rationalization.
What security does the software developer have that you will destroy your
copy of the software if you don't like it? Maybe YOU are an upstanding,
honest individual but can you guarantee everyone will 'play fair?' Most
developers would be thrilled to handout free 'test' copies of their s/w
IF they knew they wouldn't be ripped off. But that's just not realistic.

>Like i said in my first message. All software should be shareware.

In a perfect world, I would agree with you. And developers would LOVE it
as it is a LOT cheaper and easier for them to distribute shareware. But
we all know that very few people register the shareware they use so...

I'd bet that if you spent a year or so as an Atari developer trying to
feed your family on that income alone you would soon change your opinions.
Either that or else you would likely starve. :)

DD> I have looked on several Internet sites, but am unsure what filename
DD> I should be looking for :)

Try BinkleyTerm. It's PD, and at version 3.14, though there is a brand new release just out. It runs fine on the Falcon, as long as you set 'Port 2' in the config file. Binkley isn't the nicest mailer, as it's strictly TOS, but it works!

Loo for archives begining with BT in the comms directories. I think it's on a.a, but I'm not sure if it's a recent version. If you've got any probs, drop me an email.

Brian.

>MIKENET is available at the hensa archive and claims that you can let
>STs share a hard drive.
>
>Anyone have any experience of using two machines on one drive, linking
>via midiports (what you need) or using this software.

I tried it, but like mosts things, when I loaded all my *real* software (1-2Megs of MiNT stuff) it rapidly fell over. Attempts to contact the author by email came to nothing so I gave up on it. Nice little package though, although the shareware registration is a tad high IMHO.

I'm currently playing with MiNT-Net, which is far superior, but still in quite early stages of development.

:-)

Message-ID: <319ghh$739@Tut.MsState.Edu>
Source record: 183033

Aloha...
Just read the thread on Neodesk4..I can't wait to try it out.
I"ve been running NeoDesk 3 for several years now...and Geneva for
about 6 months now. They are an extrememly worthwhile combo for those
who simply want to use their ST to get a job done quickly and simply.
I've yet to see a software upgrade that milks any computing system of
its potential as well as Gribnif utilities do. So what if NeoDesk4 is
a little late...better late and working than slaped togehter just well
enough to waste HD space and get in the way untill the fix patches come out.
Sometimes deadlines do have to be pushed back...face it.
Espically for perfectionists like Gribnif and Codehead.
If there were ever two developing houses who strived at getting it
right the first time, and shooting for a cooperative standard whereby
appliciations of all types work together in harmony...they are Gribnif and.
Codehead. Also...hats off to these guys for managing to keep quite impressive
packages within an extremely attractive and affordable budget.

ONe thing I would much like to see as NeoDesk and Geneva grow up, and that's
for them to take advantage of the many ports and slots that go to waste
on the STE. It would be nice if one could use the NeoControl accessory to
tinker with the Midi Ports (Midi Thru, baud, etc), and maybe even figure
out a use for these mysterious joy stick ports in the left side of the
520 and 1040STE machines. Also...a much attractive feature would be if
the TOS in a window and CLI programs would let you multi TOS as well as
multi GEM. Unix like redirection of the Standard Output via NeoCli would
be a nice feature too. It could prove extremely useful if one could
redirect and rename output from the regular serial port to the MIDI port,
or vice verse. This way one could hook up several modems to the ST and
get them all running at once without a multiplexer. And for those with
memory to waste on samples...the DMA and Sound chips offer potential for
tons of desk top fun and usefulness. Oh well...I'm getting carried away,
and am mentioning things that I'm more than sure Gribnif engineers have
thought of and are working on...so I'm off..with a tip of the hat for
the outstanding job they've done so far...I"ll keep buying it...even if
it is a bit late.

Brian.

Are you using a 520st? If you are it is most likely do the fact that the 520 dosen't support rts/cts flow control. If you have are using a another atari you may need to run a patch that will correct this problem.

I'm using a 1040st with a patch for tos1.4 and using T-term (another excelent prog!) and have had no troubles yet.

I'm not a pirate personally, but I do agree that things that the
software companies say is blown way out of the water, for example;
when Michael Jackson's largest album was released called Thriller
it made a estimated 400 million world wide, yet they estimated they
lost over another 200 million over piracy of that particular album
due to copies to cassettes etc. Come on, the album cost only a
mere 4 million to produce and distribute@!!! I'm sure that the
young buck at Microsoft is not eating my cat's leftovers. Think,
just think of the dough involved here! Think of how much piracy
goes on in the Dos world let alone Atari, and I believe that we all
know a few pirates on that platform don't we?

This is only my opinion of this entire situation and I still firmly
believe that if everyone was a pirate, of course we would have not
a platform for the Atari at all, but the piracy that is out there
is probably by the most part anyway, by person's who could not
afford the software anyway and the purchase of that said software
would not exist anyway, so I believe why bicker! I pay for what I
use, but this sort of topic is getting pretty old and boring as
far as I go anyway.

I won't repost Mauritz's trash, but I'll recall that he's been predicting the imminent failure of Atari for at least 4 years. The stock price, by the way, has been both above and below what it was when he started making those predictions, and is now reasonably close to where it was then. The company's biggest assets in that time have been Time-Warner's devotion to keeping Atari in the consumer market, and the Tramiel family's fascination with the computer business. Not things that appear in an annual report.

> (NVDI) and many many more?
>
> Hey wake up, we have e-mail in Europe, too ;-)
>

Hey, if you Europeans want to be placed on this list, YOU have to do the
waking up!

Users will not be placed on the list unless the maintainer (myself)
receives e-mail from the person.

Why do I do this? I don't want to get bitched at by people because they
are on a Who's Who list when they want to remain as silent as possible.
Some people like it that their e-mail address isn't well-known.

Another reason is because ALL the people on the list KNOW that they are on
the list. If a situation would change concerning their status or e-mail
address, they realize they are on the list and contact me.

If you want to be placed on the Who's Who list then give me information about
yourself. If you want a favorite developer of yours to be placed on
this list, tell them so they can write me.

Hi Darren,

Yes, I am sure you will be able to purchase a Falcon. There will be several Atari dealerships at this show. I do not know how much they will be charging for the Falcon030.

Toad Computer will be there, as well as The Computer Shoppe, AAA Video, and many other dealers. We are in the process of contacting more dealers to attend the show, but we are already almost out of tables!

That's okay. I already did. <snigger> But hey, the README file was
well put together, just that it didn't seem to outline the plots of the
various levels, which I felt was sort of a necessary element that was
overlooked. (It kinda helps to know what you're trying to go for when
playing a game. :-) Just my opinion, though.

Well, if you read the article, you'll find that noDesk will not be
sold outside of Germany.

It seemed to handle LZH (etc?) archives exactly the same as normal
GEMDOS folders, which was clever. (Opening an archive appeared to be
the same as opening a folder on the desktop, if you see what I
mean...)

OK, but as appl_getinfo() is only documented as available from AES
4.0, and MagiC returns an AES version of 3.99, what do you do? My
point is that you have to special-case your software to handle MagiC's
functionality, and (IMHO) you shouldn't, as it is functionally a
subset of MTOS (AFAIK).

1414. New Atari ST Guitar Program

Newsgroup: comp.sys.atari.st
Date: 1994-07-29 09:07:45 UTC
From: richara@westminster.ac.uk
Message-ID: <Ctp2J0.5Hx@westminster.ac.uk>
Source record: 182957

This hasn't appeared in atari.announce so appologies to anyone who
feels that it is inappropriate in here.

****
Announcing The Guitar Reference
A Shareware GEM Guitar Tool for the Atari ST.
****

At the moment the tool acts as a Scale Reference, and Tuning reference.

The demo version of the tool is available from anonymous ftp at:

micros.hensa.ac.uk

in

micros/atari/tos/o/o021/guitdemo.zip

or www on

http://mic2.hensa.ac.uk/

we will upload to other ftp sites in due course, but if you find out that
your favourite site doesn't have it then feel free to upload the demo version.

Details of the full version of the prog follow later, the demo version has
all the features of the full version but is unable to save and load scales or
tunings, or print.

****
Demo version
****
5 scales in memory
1 standard E tuning in memory
new scales and tunings can be created and manipulated but not saved

****
Full Version
****

==========
Scale Reference
==========

Features:
----
57 scales in the database
new scales can be added
scales can be edited

scales can be displayed on screen at a variety of zoom levels
scales can be displayed as text (showing each note name) or graphics
scales can be automatically transposed into the following
keys: A,A♯,B,C,C♯,D,D♯,E,F,F♯,G,G♯
scales can be printed out to hardcopy
scales are displayed using the current tuning automatically
root notes can be highlighted
relative scales can be superimposed on the display

==========
Tuning Reference
==========

Features:
---
46 tunings in the database
tuning can be done through the soundchip or via midi
new tunings can be added
tuning is easily done with a mouse click

==========
Registration
==========

Registration details are given in the archive and costs 5 pounds.

If you are a guitarist then I hope you will download it, try it, and hopefully
enjoy it.

Thanks,

Alan

>sells software that does not work as advertised then obviously this is
>wrong. But you make it sound as if every single software developer in the
>world is guilty of this and THAT my friend _is_ rubbish.
>

No it's not, cause to much software IS like that. It somehow seems that people
accept faulty software these days, just because there isn't any alternatives.

When we had the same discussion going on in NeST long time agao, i kept on
mention faulty software, and eveytime others returned with an answer saying
"other programs contain bug's as well", just to make it look okay.
This is rubbish, and with this future feelings about our software, we will
live wth faulty software for the rest of our days, UNLESS someone starts
do something.

>Problem is that most people don't register shareware. A simple fact, but
>it creates a very harsh reality.
>

Another problem with shareware is, that often it take more money to transfer
money to the author, than paying for the program only. I have this problem
with several programs. It cost 5ï¿½, but it'll take me 10ï¿½ to send the money.
Thats stupid, (but no excuse for not paying). But i'll rather try find a
solution that so much money isn't wasted on nothing.

Btw, i like FANSI. Just wish it could do 640*480 on the Falcon.

>downloadable patches.

I don't know if it's intentional, (i really don't hope/think so), but still
to much software are beeing prodduced which includes bugs. I could name
several, but i think you know what i mean, so there's no reason for this.
One wrong sentence in a book doesn't mean you can't read it. If it did then
yes, i would demand my money back or another book.
Download patches is a good idea. Only problem is, if it doesn't reach all
the custumors.

>First of all, most software from reputable developers works. So this
>example doesn't even happen. The issue is if you find a bug. We've always
>jumped right in to fix our bugs. However, we still feel we have to print
>a disclaimer, this is necessary because of the legal climate in the U.S.

I'm sorry to say, but it's not all reputable developers software that work.
Or then i just don't know who you sees as reputable developers.

>
>> If the company asked the consultant to modify the software, then it's the

>
>Hmmm. Obviously you are not aware with the way liability lawsuits work
>here in the U.S. The more correct answer is "if the company can convince
>a jury that the developer should have found a way to prevent tampering,
>they can find the developer negligent and ask for damages (money)".

It'll be a lawsuit between the company and the consultant, not between the
custumors and the consultant, which was what you made it sound like in the
first place. The company will have obligations for their custumors.

>We've never done this. We don't plan to start, either.
>

I can't argue with this, as i'm not sure what you did develope.

> box. Perfect for Gadgets users.

A brand new Mac external 3.5" 105mb Syquest unit (with one cartridge) is selling for $289 from Dirt Cheap Drives (in Computer Shopper). An ICD Link II is ~$100. So, for ~$389, one can have a much faster 105mb cartridge drive that can be hooked to a Mac simply by unplugging the Link II.

I don't intend this as a flame, just information for those who don't realize how much Syquest devices have fallen recently. The 105mb mech is very very nice. It spins up in about 5 seconds (verses the 44mb 15 seconds or so). Cartridges are only $69 (same price as the 44mb carts), and are the size of three 3.5" floppies stacked atop one another. These drives make my two 44mb units look slow and pokey by comparison. There are also 270mb 3.5" mechs available, as well as 44/88 and 200mb 5.25" mechs. I saw a demo 5.25" mechanism at a computer show that could do 1/2gb (and read/write 44/88/200mb carts as well).

>subset of MTOS (AFAIK).

WinX also implements appl_getinfo, so the function can be available even
in TOS 1. This is a problem. I believe there's a protocol which goes
something like this:

```
IF AES>=400 or
appl_find("?AGI")>0 or
wind_get(0,WF_WINX,0,0,0,0)=WF_WINX then
appl_getinfo_exists
```

However, I tried this with MagiC and I couldn't get it to work.

I don't know about manufacturing costs, but I currently own both an original Lynx and a Lynx II, and much prefer the Lynx II. It is stereo capable (though Klax is the only game I know to make use of it), smaller length-wise and has an easier-to-use joypad, IMO. And, the case color is molded into the plastic instead of painted on, so it's won't chip off.

The first Lynx may have been more expensive, but it wasn't necessarily any better.

After all those years of using it how could you not mention BinkleyTerm-ST
Daron. ;-)

AFAIK it will run on a Falcon fine with the right patches, drivers and setup.

The First LYNX is definitely made more expensive and probably a little better in quality. I have a "GOOD" lynx II now, I've had to take it back and have several replaced because they either were not put together right, or the backlight didn't function properly. I have been trying to order; or atleast find an older LYNX I, but have had no luck do to the fact that they don't make them any more. But now, I have the lynx II, and have not had any problems with it so far...

From: selick@acs4.bu.edu
Message-ID: <31bj67$grt@news.bu.edu>
Source record: 182972

My brother is selling the following Atari ST hardware. He will consider breaking it up, but would rather sell the whole package for $600. Breakup prices are included next to each item. Please respond to <selick@itt.com>

1040 ST - Tos 2.06, 1 meg ram, dsdd 3.5" floppy drive. Includes PC-Ditto II board which is not connected because it made the ST intermittant (note: the ST is absolutely solid without the pc-ditto board installed!) $200

SM124 monochrome monitor - $75

SM1224 color monitor - $125

150 meg MFM hard drive subsystem - includes Supra SCSI host adaptor, Adaptek 4000 SCSI -> mfm controller, and 1 Maxtor 150 meg MFM hard drive with 28 ms access, power supply, and a homemade case. Assembled, and ready to run! $175

Spectre GCR 3.0 with Mac 128k ROMs - $175

Okidata 92 9 pin printer - $75

Please feel free to make offers if you don't like the prices. Again, he will happily take the first $600 offer for the whole lot!

Call Bill eves until 10pm at 201-569-8421. Items are located in northeastern NJ. Prices do not include shipping. Please discuss terms with Bill.

I know all about people who use software they haven't paid for.

I've gotten first, second, and third-hand reports from all over the world
about people who use and absolutely LOVE ANSITerm.

Yet the number of registrations totals to just over 30.

I've had countless requests for version 1.90 (the unregistered version),
but I never hear from these people again. They do not register.

No, programs should NOT all be released as shareware because most people
are not honest enough to pay for shareware software that they frequently use.

I misquoted the information above. The price I looked at does _not_ include
a cartridge, so add $70. Still damn cheap!

Message-ID: <31bt0k$1be@charm.magnus.acs.ohio-state.edu>
Source record: 182976

There are a few MPEGs available at grind.isca.uiowa.edu in the Image directory. You can also telnet there with the login 'iscabbs'. Anyone know any better sites other than the ones on the web.

How about FLIs, I saw a site in Europe with a number but was uninterested at the time. Now that I would like to find them, I can find it.

Dan

Well, if Atari is succesful in selling the Jaguar it will only lead to
improvements in the game computer range, not in new home computers.

>But be that as it may, if the Jaguar fails miserably, you can bet that
>Atari as we know it will likely collapse as well. It seems a cruel twist
>of fate to me that I should buy a GAME system to help insure the continued
>existence of a great desktop computer!

No it's just plain pathetic...

>>I am only afraid, that software developers stop developing for the Atari
>>platform if Atari stops to produce

They already do, and I can't blame them, in a system which has no future,
you wouldn't invest...

>But hey, even if Atari Corporation folds that does NOT mean the end of
>Atari computing! We can still enjoy these great machines for a long time
>to come. The 8-bitters have been without any real support for years but
>they still have a lot of fun, regardless. I reckon we could too. :)

Nope, but we are left in the cold for anything new.... Like Multimedia,
CD-ROM, High-res graphics, speed, availability, 'power' without the
price....

Hi Dave,

DC> Does anyone know where I can find a fidonet mailer and reader

the best supported FidoNet mailer is Semper (current version 0.71beta). It's completely in GEM. You'll like it.

DC> that is compatible with the Falcon.
DC>
DC> I have looked on several Internet sites, but am unsure what
DC> filename I should be looking for :)

look on ftp.uni-paderborn.de, there is a packet smp_beta.zip which contains all files needes for setup and also the latest update as smp_071b.zip.

Greetings, Joerg

Hey there.
Mo, I am not using a 520. I am using a 1040Ste with 4 meg RAM and
a ICD Fast 50 meg HD. Tos 1.6, etc...
I cannot figure this out, some people have no problem,
others cannot get it to work at all...guh

>The drive ID is set to 0, but the Falcon does not recognize the drive.
>He is using a 4MB RAM, 80MB IDE Falcon with the Atari HD driver (6.61)
I had a similar problem. No programs recognised the 1.08GB drive, no matter
what SCSI ID it had. Only ICD's IDCHECK sensed there was something there: It
waited for response from whatever ID the disk was at the time. If I cut the
power to the drive, IDCHECK sensed this, and went on. Realy weird.

I finaly had the vendor exchange the 1.08 GB disk for two 540 MB disks. They
cam on without problems. I have no idea what the problem was, sorry.

>developers would be thrilled to handout free 'test' copies of their s/w
>IF they knew they wouldn't be ripped off. But that's just not realistic.

The developer got no security at all, but on the other hand, the custumor
doesn't have any security either if their just bought software will work
or not, without beeing able to test it. And still, it's the custumors who
are the one paying for this. These are the same guy's who are going to
continue to support the developers, IF! they'r treathed right.

>In a perfect world, I would agree with you. And developers would LOVE it
>as it is a LOT cheaper and easier for them to distribute shareware. But

I would never ever try to feed a family from developing software. No matter
what platform we talk about, it's very few people who can live from developing
software.

Whats wrong in borrowing software from a friend, and at least make sure the
software isn't run twice at the same time on two different computers.
I guess this is not against any rule of copyrights, right ?

>All of this may be true, but your point's still not coming through. Are

I not looking for anything, but rather telling us guy's how it's or can be
like to be an custumor. If i could make sure all software i buy will work
the way it's suppose to, then i have nothing against the way it is now.
But this is just an secure i can't get, and thats also the reason i don't
accept the way it is now.
I'm open for alternatives and conversations. I could if i want just say,
hey, you'r the developer, you go figure out a better solution. But that'll
not help any of us.

What if you didn't have an atari, and you couldn't get a refund. In what
situation will that put you ?

I guess it's time to cut into paper what i mean. This is a story from my real world.

A year ago i ordered a new BBS package, cause some of my friends had an textfile coming from the author of the BBs package telling anyone it was the best alternative. And from this textfile everything looked good.

Together with one of my friends we ordered both a copy, (from the US) paying about 90ï¿½ each (+p&p included). After a few months it arrived, and i spend about two months trying to setup this BBS, ran into alot of problems, found much of it didn't working.
In the meanwhile there was alot of updates coming, so i saw no reason in the first place to send it back, (from the manual i got one month to decide wether i want to keep it or have my money back. But i spend more than a month just trying to set it up).
After about 4 months i gave up. This new BBs had been running about 2 hours online, i have spend several hours to do the setup, and everytime i ran into new problems and things not working as they were suppose to.
What really did that i gave up, was a new version arriving. Every new version had an install program, but this time i couldn't even install the new version on my Falcon, but on my STE it did fine. (it has since been reported as an bug).

I have ever since tried to get my money back or sell it to another friend, cause this is just not the BBS for me. From the manual it's stated one month money back guarantee. I couldn't manage to decide in that month. Also it's stated i can't sell or give away the package, cause in some of the files there is my sysop and BBS name written and the author will not change it. This means i'm stock with this BBS even though i have another friend who's willing to buy it from me.

This is a commercial BBS package which has no demo version or anything. I ordered from what i saw in the textfile, just to discover that wasn't the case. Also the author is known to be a decent developer of Atari software, (decent my ass!).

Now you tell me how much this gain the author that i have this BBS not online but in a corner collecting dust, trying to get rid of it. ?
If this author was decent, he would understand my problems and let me sell it to another guy who's willing to offer the needed time, and stand against whatever bug's might appear in the future. I was even willing to give it away for free, but no can do!.

This is just one story from my world. Take it as you want, it could improve your ideas about me.

Greets
Kim

>horror stories that my co-workers tell me.)

Thats has to be because of your laws. That will never happen here in Denmark.
If something isn't working here when you buy it, the dealer got obligations
to take it back or fix it in a decent timeperiode (which depence on what we'r
talking about).

>You've already said that you think people should pay for software if

I don't think a true pirate even cares at all. They probably just laugh.
But i dont understand why those people who do pay should suffer from this.
At least they'r the one who are going to support in the future as well. If
i was a developer, i would rather try spend my time on those who's willing
to pay, rather than to spend alot of time and resources on those who don't.

>> Did Atari ever release their transputer addon for the ST series. I
>> believe they were talking about it 3 years ago. It had a target price
>> of 600 pounds sterling and could be fitted with up to 4 transputers.
SJ> No. Although I believe Atari U.K. did some 'preliminary' R&D on
SJ> the STT, I think they gave up on it fairly quickly.
SJ>
Atari only released the ATW but a British company (Kuma) released a Transputer addon for the ST range which connected to both the cartridge port and I think the parallel port?

I can't find my old copies of ST World (it was a great mag!) but I believe that it would take something like 4 T800 transputers and came with Occam.

Kuma gave up the s/ware h/ware side some time ago and now concentrate on publishing.

For those Atari users who only communicate buy modem.
Before the computer people use to talk to each other with words for their very
own mouths.

Please, before you post bad information. Pick up the telephone and call an
Atari software dealerand ask them if said software is still being supported
buy the author.

Most of the Atari dealer's I talk to when I order I ask them if the item is
still has support this information, before I make my purchase.

Stephen Jacobs (saj@chinet.chinet.com) wrote:
: I won't repost Mauritz's trash, but I'll recall that he's been predicting
: the imminent failure of Atari for at least 4 years. The stock price, by
: the way, has been both above and below what it was when he started making
: those predictions, and is now reasonably close to where it was then. The
: company's biggest assets in that time have been Time-Warner's devotion to
: keeping Atari in the consumer market, and the Tramiel family's fascination
: with the computer business. Not things that appear in an annual report.

I love how the die hards ignore all fact and base arguments purely on
personal attacks....Heh.

The "trash" was taken directly from the annual report of Atari Corp.
And if you'll recall, I said several years ago that if Atari was going
to survive, it would need to stop wasting money on its computer business
because they couldn't compete. I think the only reason it is still
around is that Time Warner needs a reasonably cheap way to hop on
the multimedia bandwagon and the Atari name might help. Many people
that are in prime buying power now still remember the days when
Atari owned the home video game market. I'm glad they finally threw
in the towel on computers and will now spend shareholder money on
products that they can sell.

Dave - should Starball run fine on an old 1040ST with 1 meg and TOS 1.04?
I just tried loading it up on my old system and although the credits
screen pops up and the music plays, the game board never appears. The ST
either switches to black or hangs on the last screen that comes up after
the credit stuff.

I've been running it on both my TT and Falcon without any problem.

Wrong. There are "two" users involved one "two" different computers.
Doesn't matter if the software isn't being run at the "same time". That
still violates both U.S. and European copyright laws. This about it,
"two" people are using the software, yet only "one" copy was bought.

> Together with one of my friends we ordered both a copy, (from the US) paying
> about 90 each (+p&p included).

If you are setting up one BBS, this is OK. But if you are setting up two
BBS systems, this would not be legal. "Two" copies, "one" purchase.

> I have ever since tried to get my money back or sell it to another friend,

> willing to buy it from me.

Have you actually CONTACTED the author (you know, write a short note
explaining your problem)? I'm sure that in the least the author would
have NO problem in re-registering the program to your friend who wants to
buy it (though after all the problems you had, your friend might not
remain your friend too long ;-). As a developer, I hear stories like this
quite a bit. Most times I am amazed how many people will not contact the
author. I don't think we have a single customer who has come away unhappy
after contacting us with a problem, regardless the problem.

> (decent my ass!).

Again, I ask. Did you contact him? If so, what did he say?

...[info on Digitape deleted]...

Friends, it's time to tell you that CodeHead Technologies, as you have known it, is no more. The people behind it, Charles, John and (lately) Tomas, the quality and dedication that drove it, these things are here and alive, make no mistake. However, the company that maintained a staff (of one) and provided telephone support are gone. Gone. It is no longer possible. We are all making a living in other ways.

For the last four months I've been all alone at the office of Codehead (The redecorated attic of John and Julie's beautiful home), napping mostly, and maintaining the illusion. Pretty damned depressed, too. John has been working at Fox Studios with his wife Julie, doing the behind the scenes work on the music that accompanies the TV shows and movies you love. Charles has been gigging with Al Jarr... how DO you spell that... Ja row...? Jaroux...? Who cares? My CD collection is way downstairs...

Me? I've taken a job in the health care business. I push paper across my desk, and try to maintain a Windows machine. Brother, I'd rather be singing in a bar somewhere... How I hate the 90's.

And so it goes... And that's the way it is... And so, as we began, good evening everyone.

===Tomas===

Category 30, Topic 18
Message 6 Sat Jul 30, 1994
MUSE [Tomas] at 10:23 PDT

Scotty,
We'll all be here, just as before. The office will probably be unmanned, that's all. CodeHead products and updates will still be available but will be
handled differently.

Don't get too excited folks. I said "CodeHead as you've known it". Things are changing, that's all.

===Tomas===

Category 30, Topic 18
Message 8 Sat Jul 30, 1994
J.EIDSVOOG1 [CodeHead] at 12:31 PDT

Tomas's description of our current state is correct, although his terminology may have been a bit misleading. As he mentioned, there are no longer any "office hours" or anyone answerers of phones. We'll still attempt to provide support in whatever manner possible, though.

It was with a heavy heart that we had to cut Tomas's hours to two days a week (in late May). As thisresulted in a serious cut in pay, he was forced to find another job. I'm happy that he was able to do so without a long period of unemployment.

The absence of anyone in the office has not affected sales, since there have been none to speak of anyway. When there are no new computer customers, there's no reason for anyone to buy any existing software. The existing Atari users already own what they need and it doesn't make good business sense for us to develop any new software for the small core of users that are left.

Sorry about the topic drift. This discussion really belongs in the CodeHead area, although I've been avoiding it because of the emotions that it may release.

John

- This is being posted for a friend, if you're interested please send
mail to this account..

* Atari 520ST upped to 1 meg
- one slight problem, it doesn't work at the moment. Although I think
this is an easy fix - the keyboard connector is probably loose.

* two double-sided 3 1/2 drives

* mono monitor

* mouse

* 1200 baud external modem

* 9-pin printer, form feed

* disks of assorted goodies

* all cables, power supplies

* some manuals

* RF modulator

He also has the following Stephen King hardcovers he'd like to move as well:

* The Shining
* Misery
* The Tommyknockers
* IT
* Different Seasons
* Firestarter
* Night Shift
* Skeleton Crew
a few others..

If you are interested in the above, please send your offer(s) to this
account. He'll split the stuff up, keep it together, dance around it...he
doesn't care so long as you buy it. The best offers received by 8/5 get
the goods. Buyer pays shipping. Questions? Send them here and I'll
pass them on to him.

or * TRADE *

The other option he's interested in is trading for something interesting. A good pair of binoculars, Tandy 100SL compatible hard drive, CD's, a camera, anything else that's reasonably cool. Terms are the same as above, best offer by 8/5 gets it.

Frankly, Kim, it would put me in someone else's paranoid fantasy. In
the REAL world, the developer offered me my choice of solution.

My first thought concerning the story you related was that it would be
wonderful to have a way of collecting all these stories -- good and bad
-- as a sort of Internet product and supplier review. It wouldn't help
your specific problem, but over time might save us all from wasting
money and taking bad risks.
(I still don't believe, though, that if person X hurts me that it
justifies me in hurting person Y. I'm responsible, to me, for behaving
decently and that responsibility doesn't go away just because I discover
that others are behaving badly.)

Er...how sure are you on this? It was my impression that copyright law
only dealt with limitations on people infringing your distribution
rights and license agreement -- whatever that might be. Not that it
dictated what terms your license must include.
For instance, taken from a Borland product, "...this software may be
used by any number of people and may be freely moved from one computer
location to another, so long as there is no possibility of it being used
at one location while it's being used at another."
I think the answer is: you get to do what the vendor says you do, so
pick nice, understanding vendors. :-)

This sounds rather odd to me, Rick. So that means we can't give software as presents nor can we sell second hand software? I hardly see the point of preventing people from borrowing s/w from one another....

If borrowing s/w and running it on _one_ machine only is classified as software piracy then it looks like I'm a pirate - as are about 99% of everybody reading this message!

Saw this on genie and thought I would post it here for the folks
who were trying to get in touch with Toad Computer.

TOAD COMPUTERS -- PRESS RELEASE -- JULY 20, 1994

It's official, it's for real, it's packed with stuff and it's headed
your way now! Watch for the new Toad Computers PRODUCT CATALOG! It's
being mailed to 25,000 of our closest friends and you're probably one
of them! If not, call us TOADAY and get on our mailing list! We want
to make sure you have the latest information on the products available
for your Atari!

The Toad Computers PRODUCT CATALOG is a full 56 pages packed with
software, hardware and accessories picked EXCLUSIVELY for current and
prospective Atari owners! Get the latest word on all this and more:

- Lynx Games - Jaguar Games
- Falcon Prices - Monitors
- ST Computers - ST Games
- Speedo GDOS 5.0 - CD ROM Products
- Graphics Programs - Desktop Publishing
- Word Processing - Scanners from $109 & Up
- Printers - Oregon Research Software
- Codehead Software - Database Programs
- STraight FAX! - FAX Modems
- Terminal Programs - Falcon Voice Mail
- NeoDesk 4 - Mag!x & Kobold
- Programming - Magazines
- Emulators - Gemulator for $99
- Repairs - Spectre 3.1
- New Toad T-Shirt - Cables
- Custom PC Systems - Atari Portfolio
- Accelerators - RAM Upgrades
- Hard Disk Drives - Tape Backups
- Diamond Back 3 - SyQuest Drives
- Atari 8-Bit Products - Music & MIDI Software
- Cubase / Steinberg - Notator / EMAGIC
- Spreadsheets - Financial Software
- Educational Software - Edit*Plus
- Mice & Joysticks - Cheap Games
- Recipes - Directions to our Store
- Beetle Mice - Our Reader Survey

WATCH FOR IT in your mail! It has a bright yellow, full color cover!
You can't miss it! Also announced in the catalog are the following new

services from Toad Computers:

TOADFAX FAX-ON-DEMAND SYSTEM: (410) 544-0098

Beginning in mid-August 1994, TOADFAX -- an automated, voice activated FAX-On-Demand system -- will distribute pricing and product literature to Toad customers.

Simply call the system, enter the numbers of the documents you wish to receive using your touch-tone phone. You can choose between entering your FAX number and having our system call you back, or receiving your documents on-line at the time of your call.

TOADFAX is intended to cure a common problem in today's fast paced computer market -- information obsolesence -- and gives customers a fast and easy way to check up on prices and product information.

TOADFAX can be reached by dialing (410) 544-0098 and will begin operation in mid-August 1994.

TOAD MUSIC MIDI INFORMATION & MUSIC TECH SUPPORT HOTLINE

We continue to expand our support of MIDI and music software by adding another phone line specifically for that purpose. While you would still use our standard (800) 448-8623 order line for placing orders for all products, if you need technical support or even buying advice, on MIDI products, call (410) 544-7495.

TOAD T-SHIRT: "MY OTHER COMPUTER IS AN ATARI!"

Also available in August 1994 will be a new Toad T-Shirt! This is the first Toad T-Shirt in almost four years and it's sure to be a hit!

ON THE FRONT: My Other Computer is an ATARI!

ON THE BACK: ATARI Logos (from Catalog Cover)
Toad Computers
America's Atari Source!

The front is in blue. The back is in full color and features various Atari logos (Fuji, ATARI, Lynx, Jaguar, TT, ST, STE, Portfolio and Falcon030 -- each in a different color!)

This rugged shirt is 100% Fruit-of-the-Loom cotton and more stylish than a hairpiece!

AVAILABLE AUGUST 1994! PRE-ORDER YOURS _TOADAY_ FOR IMMEDIATE DELIVERY!

Small, Medium, and XL: Only $10.00!

2XL and 3XL Sizes: Only $14.00!

==========

TOAD COMPUTERS -- HOLIDAY FESTIVAL '94 ANNOUNCEMENT!

Toad Computers is proud to announce HOLIDAY FESTIVAL '94 which will take place on December 3rd & 4th, 1994. Last year's event drew a surprise 500 people from all over the country and featured guests and exhibitors such as:

- Dave Small
- Joe Waters, Ed. of Current Notes
- Charles Smeton (STraight FAX!)
- Dave Troy (CN Columnist / Toad Co-owner)
- Tim Reyes
- MajicSoft
- Carter's Creative Computer
- Greg Ondo of Steinberg Jones

All Atari developers and user groups are invited and will be given FREE table space if pre-registered by November 1, 1994. Tables requested after that time will be $150 each. Space will be allocated on a first come, first served basis.

We'll feature free hot apple cider, door prizes and more! We'll also have another raffle to benefit Habitat for Humanity (which raised over $500 last year!!)

The show will take place at TOAD COMPUTERS in the Park Plaza Shopping Center in Severna Park, Maryland. There's unlimited free parking and lots to see and do nearby, as we're nestled between Washington, Baltimore, and Annapolis.

TOAD COMPUTERS HOLIDAY FESTIVAL '94:

Saturday December 3th 10:00am - 7:00pm
Sunday December 4th 10:00am - 5:00pm

Toad Computers
Park Plaza Shopping Center
570 Ritchie Highway
Severna Park, MD 21146-2925

Voice: (410) 544-6943
Orders: (800) 448-8623
FAX: (410) 544-1329
BBS: (410) 544-6999
TOADFAX: (410) 544-0098
MUSIC/MIDI: (410) 544-7495

For MAPS, DIRECTIONS, HOTEL ACCOMODATIONS, or any other information you may need, please call us!

Keep an eye open for further developments on the show! We plan to have announcements on and in:

- GEnie - CompuServe
- Internet - Delphi

- Current Notes - ST Informer
- Processor Direct - Anything We Can Think Of

We will also be mailing postcards in support of the show
sometime in November. If you know of someone who would like
to come to the show, give us their name and address and
we'll be sure they get the information!

ADMISSION IS FREE!!!! ADMISSION IS FREE!!!

==========

NEC CD ROM DRIVE SPECIALS!

We have the best deals on CD ROM drives for your Atari! Here are some
prices on our legendary NEC Drives!

- NEC CDR25 150K/sec, +/-600ms $ 99 Portable

- NEC CDR210 300K/sec, 280ms $279 External
$199 Internal

- NEC CDR510 450K/sec, 195ms $379 Internal
$459 External

- NEC 3xe 450K/sec, 195ms $599 External
NEC 3xi $499 Internal

- NEC 3xp 450K/sec, 250ms $449 Portable

Take one look at this chart and one obvious question emerges:

WHY ARE THE CDR210 AND CDR510 so CHEAP compared to
comparable drives from NEC?

The answer? The NEC CDR210 and 510 are OEM (original equipment
manufacturer) versions of their popular double and triple speed
drives. They function identically to their higher-priced counterparts!
You might want to spend a little more to get the 3xp, 3xe, and 3xi
drives because of their sleek styling, or cool looking plastic cases,

but you don't have to! The 210 and 510 drives give you all the power
at a significantly lower price!

EXTENDOS $19
Audio CD Master $29
Photo Show / PS Pro $29/$39

CD ROM's:
GEMINI Atari CD ROM $29
Bitsream 500 Fonts $44.95
Qwikforms CD ROM $49
Project Gutenberg $29
Fractal Frenzy $29
GIFs Galore (no adult) $29

Source Code $29
Clip Art Cornucopia $29
Space & Astronomy $29

GERMAN PD CD!!! $39
GERMAN PD CD 2 $39
Winning Pictures $29
Font Funhouse $19
Font Pro Vol 1/2 $25
EPS Pro Clip Art $139
EPS Pro Clip Art 2 $139
Corel Photos $39
Sound Library Pro $25

DON'T BE FOOLED! YOU NEED AND WANT THE QUALITY OF A SCSI CD ROM DRIVE ON YOUR ATARI!

We have received a few calls from customers who say that they have seen double-speed CD ROM drives on sale for $150. Well -- this may be true, but what they are seeing are usually IDE (PC compatible) CD ROM drives without a case or power supply. The Atari cannot use the IDE drives -- you need a SCSI drive -- and they are more expensive than their IDE counterparts, due to their higher quality. Plus, for $199 you can get an _internal_ SCSI drive, but that's probably not what you want! You want an EXTERNAL drive, which almost always costs about $80 more! So, when you really think about it, the $279 you pay for an external, SCSI, high quality CD ROM drive is completely in line with the $150 you might pay for a generic, internal IDE drive!

-----> NEC CDR-210 EXTERNAL SCSI 2x DRIVE FOR $279!!!!

==========

WATCH THIS SPACE FOR MORE SPECIALS COMING SOON!

In my experience, the inbuilt Zmodem in Storm has been unreliable. I now use xyz.ttp in conjunction with a .BAS assigned to a key macro. The .BAS was kindly supplied by Matt Koundajkian. I belieive he has uploaded it to umich.edu .
I find this setup to be easy to use and reliable for uploading and downloading.

Eric S Johansson (esj@harvee.billerica.ma.us) wrote:
> is there any way I can replace my atari mouse with a PC trackball?

You could certainly get an Atari trackball (designed for use on Atari STs, that is). You might try Toad computers (1-800-448-TOAD). I just got their new catalog (a nice fat one!) and they listed at least one type of trackball within. Do be sure to ask for a catalog, this new one is very nice indeed.

There was a company that advertised in Current Notes for awhile that offered Wico or Atari trackballs converted for mouse replacement use. They offered custom button placement, and you could pay a bit extra and get a billiard ball in place of the regular white one. Pretty neat, about $30 or so as I remember. I don't have the address handy, though.

As for using a PC unit, this could be quite a pain as they are typically serial devices (unlike the Atari mice/trackballs/etc). This means that you would need some sort of magic auto folder program to make it work, which rules out most games and such. It might be easier to modify a Mac unit (I'm not sure if they are serial as well). Amiga mice/trackballs are often very easy to convert for ST use. They are definitely not serial devices.

1482. Codeheads

Newsgroup: comp.sys.atari.st
Date: 1994-07-31 23:56:00 UTC
From: mike.hill@cccbbs.cincinnati.oh.us
Message-ID: <18351.264.uupcb@cccbbs.cincinnati.oh.us>
Source record: 182944

The whole Codehead thing ticks me off.

They haven't had a new program out for the Atari in a year or so. And to top it off many of my Codehead programs aren't current with todays Atari's. For example:

Warp 9 doesn't work on my Crazy Dots Card (Had to buy NVDI)
Maxifile doesn't support HD disk formatting.
Hotwire doesn't support Geneva/MultiTos/etc

There are other problems too, but these are a few of my concerns with some of the more useful Codehead programs I own.

I always liked there stuff, just wish they speant more time enhancing the programs instead of complaining about Atari and foreign programmers.

Just my two cents worth of ramblings. Please ignore this if it upsets you!

Message-ID: <1994Jul31.200711.27609@miavx1>
Source record: 182932

A long time ago I had this program, like DCSquish, that would compress .PRG files down quite a bit. But when you double clicked them, they'd decompress and run right off the bat.

The thing I liked about it was that there was no stupid message at the top saying "DCSquish" or anything like that and there were no flashing colors or anything...just a one or two second delay while the decompresser did its duty.

But I can't find this program anywhere?! Anyone got something like it????? I'm certain the original one I had was german...because I couldn't understand the docs!

advTHANKSance,
--Dennis

I strongly recommend Keith Gerdes' Squish II. It doesn't have the "UnSquish" message, and it can be configured for compression levels 0-9 to give you full control over speed vs. compression. It is compatible with darn near everything and best of all is supported and regularly updated! Lots of different configuration options... All for only $18.

Contact Keith Gerdes at k.gerdes@genie.geis.com or at

1487. Want some computer gaming fun? CAIN Atari Fun Fest 94

Newsgroup: comp.sys.atari.st
Date: 1994-08-01 03:51:11 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <31hrff$2ma@usenet.INS.CWRU.Edu>
Source record: 182936
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

This will be the last Usenet posting about this show besides the complete dealer/vendor, developer, user group listing which will be posted on Thursday.

CAIN Atari Fun Fest 94

Are you bored of playing the same old games?

Do you have an Atari Jaguar, Lynx, ST, TT, Falcon030, 800, XL, XE, XEGS, 7800, 5200, or 2600?

If you have any one of these systems, you can get games for it at the CAIN Atari Fun Fest 94.

CAIN Atari Fun Fest 94 is being held on Sunday, August 7, 1994 at Kirtland, Ohio (near Cleveland). CAIN Atari Fun Fest 94 will be fun for the entire family. You'll get an opportunity to see the JAGUAR 64-BIT Interactive Multimedia System and the latest entertainment titles for it. You'll even get to see video games played like they have never been played before! And that is through Lynx portable video game systems all linked together. This incredible multi-player action will blow your mind away!

The new Atari Falcon030 computer will be there along with the ST and 8-Bit computers!

There will be prizes to win and you might even be one of the lucky people to take home a Jaguar 64-BIT system or a Tempest 2000 cartridge (courtesy of Atari Corporation)! There will be many prizes raffled off such as gift certificates and games of all sorts! Everyone that attends will get a chance to win!

CAIN Atari Fun Fest 94 is the Atari -=- FUN -=- show of the year! Don't miss it! Bring the entire family down! Get great deals! See the latest technology! And have a lot of fun!

Central Atari Information Network
Presents
C.A.I.N. Atari Fun Fest 94
August 7, 1994 / 10:00AM to 5:00PM
Knights of Columbus Hall

1488. Need Macsee for the Atari

Newsgroup: comp.sys.atari.st
Date: 1994-08-01 03:59:59 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <BK2S71n.johnhechtman@delphi.com>
Source record: 182934

I have need to transfer 60 meg of TIFF files from Mac formatted flopticals to IBM/Atari format flopticals. I've found out that there is a program that can do this called Macsee by Reevesoft. Problem is, none of the Atari dealers I've called have it in stock. :(Anyone got a copy of Macsee they're not using and want to sell?

1489. Re: Freeze Dried Term

Newsgroup: comp.sys.atari.st
Date: 1994-08-01 04:11:23 UTC
From: Gordie Meyer <biblinski@delphi.com>
Message-ID: <BI-xrNr.biblinski@delphi.com>
Source record: 182935

One of the biggest reasons Aaron's enthusiasm for continued development of FzDT dramatically waned was finding out there were several 'skeleton' keys circulating for FzDT. On top of having his hard drive catastrophically crash (without backup and with all the source code to FzDT) and the resulting need to re-develop FzDT from a very early version back to where he was, he found out that piracy was very much a part of the Atari community. His emotional state at that point was pretty hostile toward continuing _any_ work on FzDT. When I approached him about having ATARI UNITED! handle future distribution and registration of FzDT, he was agreeable, but not overly enthusiastic. At that time, he was working as a programmer in the DOS/Windows environment, but he still wanted to make FzDT the program he'd originally planned it to be. Since then, we have heard little from him, beyond statements of good intentions. I suspect he's realized how much work he'd have to do to make FzDT 'right', almost from scratch, and has opted to take it no further.

Remember that Aaron wasn't 18 years old when he wrote FzDT and accepted registration money. Legally, there is little anyone can do, as a minor can't be held to a contract. He has tried to provide keys to people who have made reasonable requests via mail, and ignored anyone who makes threatening noises. He really does feel bad about the whole situation, and may be working on the next version of FzDT even now. But, again, I suspect he's given up on the TOS market as being too small to make a living from. And in that, he's not alone, by any means. The CodeHeads, while not abandoning their existing products, have publically stated they are not developing anything new for the TOS platform. Other developers have said much the same thing. (I do want to say that most of the developers _do_ continue to support their existing programs. How much further development of those programs might take place is unknown, however.) Aaron wrote a GFA BASIC telecommunications program that many people liked. It was good at the time it was written, but like many other aging programs, it isn't quite on the cutting edge today. Shareware is about paying for what you use, not necessarily what the program might one day become. If you never got a key, you have a valid complaint. If FzDT doesn't do everything you've come to expect from a telecommunications program, well, maybe it's time to look for a new program...

There are several recent entries into the telecommunications arena, and it is those programs' authors who need to hear what you like or dislike in their programs. They are still supporting theirs, after all, and are probably a whole lot more amenable to changes than Aaron certainly is. Tell them what you like about FzDT. What you wish it could do. They are the ones who want and need to hear feedback, and who might well turn your suggestions into features.

ATARI UNITED! SoftWareHouse

1490. Re: Theft = Piracy..!!

Newsgroup: comp.sys.atari.st
Date: 1994-08-01 04:47:59 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Bu8SDXv.lmcclure@delphi.com>
Source record: 182937

In your message dated 7-30-94, you quoted (Roger Sheppard?) as saying:

"Together with one of my friends we ordered both a copy,
(from the US) paying about 90# each (+p&p included)."

In your reply, you said:

"If you are setting up one BBS, this is OK. But if you are
setting up two BBS systems, this would not be legal. "Two"
copies, "one" purchase."

I took "both a copy" to mean they did indeed order two originals.
I expect ordering at the same time merely netted a lower cost in
currency coversion fees and postage.

In my case, it's the fact that I'm dead broke ... but, see below about
part of the reason for that.

> Yet the number of registrations totals to just over 30.
>
> I've had countless requests for version 1.90 (the unregistered version),
> but I never hear from these people again. They do not register.
>
> No, programs should NOT all be released as shareware because most people
> are not honest enough to pay for shareware software that they
> frequently use.

Indeed. I know that FANSI has recieved around 200 downloads from GEnie
alone. Yet, the total number of registrations I have recieved is 6.
Now, granted, not everyone who downloads the software is going to like
it, and still more won't have a use for it, but I would expect that
some of those people would register; only one of the people I have
gotten a registration from has a GEnie account (excluding one of my beta
testers who's also a GEnie member - he's the one that reports download
counts to me), and I believe he got his copy from Strobe II BBS from word
of mouth from the SysOp there who registered my program first.

No, there don't seem to be a lot of honest individuals who register
software. I have tried to take some precautions to encourage people to
register my program -- disabling some of the more important features...
perhaps I _should_ have disabled saving.

Now, granted, my program has only been out there for a tad over two
months... but even so the response, or lack thereof, is somewhat
disheartening. It couldn't be from lack of distribution -- I've gotten
mail from Germany about my program.

Shareware IS a nice idea ... unfortunately, it's less than ideal, and it
doesn't seem to work as well as it might.

> Thats stupid, (but no excuse for not paying). But i'll rather try find a
> solution that so much money isn't wasted on nothing.

I think that's a problem we all have to face with registering foriegn
programs. For me to send 5 pounds sterling to David Oldcorn for
Starball, for example (which I will do regardless) will cost me somewhere
in the vicinity of $20 cdn. (after exchange) A fair deal more than what
it would cost me if I just handed him five quid in person. And indeed,
it stil is not a reason for not registering; one can't blame an author
for his program being more expensive than normal simply due to his location.

> Btw, i like FANSI. Just wish it could do 640*480 on the Falcon.

It was never designed to, actually; I wrote FANSI to overcome the problem
of not being able to easily display 16 colours in an 80 column screen
mode on stock ST/e/Mega machines. That it works on a Falcon was
incidental, if quite good. I will continue to work on it, however; I'm
adding additional Falcon support in the next version (not much, but you
won't get screwy colours when you exit anymore). I can't promise a
640x480 mode, though; I don't have that kind of resolution to spare,
unfortunately, not and get 16 colours at the same time. I only _wish_ I
owned a Falcon. :-)

1493. Re: Starball, ARGH!!

Newsgroup: comp.sys.atari.st
Date: 1994-08-01 08:43:17 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <31icj5$6pa@m1.cs.man.ac.uk>
Source record: 182945

Basically the problems that exist in the current release of Starball (which is 1.10 I think) are mostly incompatibilities with many different versions of the hard driver, and it will only reliably work from HD on Falcon (and I believe TT's as well). There are also some other inconsistencies which CAN stop it working occasionally from floppy on certain machines.

The new version which will be out soon has had a lot of these tidied up. I really don't know how much more compatible it is, but at the very least it now works with the vast majority of hard drives. Without a lot more different types of ST I think that's the best that can be managed at the moment....

Dave

"F030 - LIST OF GAMES" NEW ENTRIES
==================================

Compiled by Heiko Hartmann
zcam1121@rpool4.rus.uni-stuttgart.de
Last Update: 07/29/94
New Titles: 16

-----------------------------------NEWS-----------------------------------
You can get the complete list (>600 titles!) from ftp.uni-kl.de.
Directory: /pub/atari/falcon, file: f_games_list.zip.
--------------------------------------------------------------------------

ST: Status. "PD" - Public Domain, Freeware, Postcardware etc.
"SH" - Shareware, Dongleware, Poolware etc.
"C1", "C2" - Commercial
C: Compatiblity. "-" - The game does never run on F030.
"+" - The game runs with ST-Emulators like Backward etc.
"!" - The game runs without modifications (in ST-Low)!
An additional "^" means: Game does also run in higher
resolutions than ST-Low or ST-High!
MHZ: Mhz-rate of 68030 (and Blitter). "8" - 68030 with 8 MHz.
"16" - 68030 with 16 MHz.
DC: Data cache. "-" - Data cache OFF.
"+" - You can leave the Data cache switched ON.
AC: Adress cache. "-" - Data cache OFF.
"+" - You can leave the Data cache switched ON.
STE: STE-Bus-Mode. "-" - STE-Bus-Mode is not needed.
"+" - STE-Bus-Mode must be switched ON.
SND: Sound. "-" - The game has no sound on F030.
"+" - The game has slightly distorted sound with ST-Emulation.
"!" - No problems with sound on F030.
HD?: Harddisk installation?. "+" - The game can be installed on HD.
"-" - HD-Installation is not possible.

A "?" means: unknown. ">?<" means: Info maybe wrong (conflicting reports)!

NAME ST C MHZ DC AC STE SND HD?

Are we going to start this again? FDT is easy to set up, and works great on low end STs. Connect is a nice piece of software, I'm sure, but I don't wish to spend my time setting up scripts to use Zmodem etc... Besides, Connect will not wrap around (at least I couldn't find a way to make it do so), is unusable in anything less than ST high, and is slow on 8 MHz systems (compared to FDT).

I'll stick with FDT until I find something better (and yes, I did try Connect, version 2.46).

NVDI 3 and Speedo 5 will not have Postscript printer drivers.

Word has it that NVDI 3 is several *times* faster than Speedo 5, which
will be very nice!

Speedo 5 is out *now*, NVDI 3 will be out in about 2 months.

HELP...

Dose any one know were I can find a Archive converter all formats,
and it must work with full paths/dates...

I had what I thought was a good one, decided to try it out, does not extract
data in folders in ARC files, and when converting to LZH it adds the program
to the archive plus the programs extraction folder....

This was CWAC3.02, the features look great, like convert all arc/zoo/lzh plus
txt in one go to say zips, but the big problem is it does not work and is no
longer supported....

So are there any otheres that have Great features like CWAC...?

Thanks....

I hate to say it, but to a large extent this is a misconception. Fact is, in the Mac market, most of the *most popular* programs are expensive because most Mac users are obsessed with having the same product as everyone else... However, there are also many excellent (even superior) packages from other companies that can be purchased for reasonable amounts of $$$. Sure, maybe only 1% of Mac users use Write Now for their word processor, but who cares? Write Now can read and write RTF, so it is compatible with just about *everything*. Anyway, if you are willing to hunt around in the Mac market you can get excellent software for your Mac/Spectre at prices closer to what we are all used to in the Atari world (although those seem to be going up up up...)

Just my 2cents worth...

1503. UK Atari show

Newsgroup: comp.sys.atari.st
Date: 1994-08-01 14:49:55 UTC
From: Iain.Laskey@barclays.co.uk
Message-ID: <31j22j$15l@bognor.barclays.co.uk>
Source record: 182707

I went to a UK Atari show yesterday. It wasn't particularly large but what and who were there was good. I finally got to see a Medusa running. Very nice, complete with 105Mb Syquest and other bits. It looked seriously fast. The New ST Emulator for PCs, Janus was also on show. This too looked impressive although I suspect the UK price will be a little too high for my pocket.
There were 2 different colour digitisers, some cheap TTs and Stacys(!), That's Write 3, the new Speedo 5 and lots of bargains. Nearly every stand was armed with Falcons with a few TTs. Calamus SL and other such heavyweights were being demoed to good effect.
One stand, System Solutions, estimated they had shifted GBP20,000 over the 2 days. Early on Sunday, the boss turned around and said 'Where did all the Falcons go?' All sold! with several outstanding orders too. I saw many people walking around with new Falcon boxes under their arms plus a fair few with Apple CD300 cdroms.
Finally, it was good to see Bradly from Best Electronics over from the US again with his table top of the wierd and wonderful in Atari spares.
On the whole, a small show but with the amount of heavyweight applications and hardware plus utilities, extras and even a few new games being demoed, it was reassuring to know the ST is still far from dead.

I've just had a POWER-UP2 32mhz 68030 accelerator fitted to my Falcon and just thought I'd tell you all what a bargain it is. It is available from System Solutions (UK) and costs (59.95 !) -> the performance improvement is about 30-40% for most apps (demo/assembler code runs 50-80% faster!), v. good value for money if you ask me, esp. considering the competition.

Cheers
Griff

I posted earlier that Squish was available for $18, but Keith pointed out
that that's not entirely correct. Here's the correct info:

>The pricing was a little off for upgrading to Squish II.
>
>If a user owns -
>DCUtils (1 or 2): $23 ($60 for both DDv2 & Squish II)
> Data Diet v1: $23 ($43 for both DDv2 upgrade & Squish II)
> Data Diet v2: $18
>[NOTE: Price includes S&H in N.America.]
>
>
>The retail price of Squish II is $40.
>Toad has it for $34 in their new catalog (TraceTech ad on p40, pricing on
>p39), along with Data Diet v2 @ $49 and Data Rescue @ $34.
>
>
>- Keith

So I missed a little info. :-) Sorry to everyone. BTW, I still strongly
recommend Squish II as the best program compressor around, and if you don't
own Data Diet v2, then get that too; it works like a charm, and has given
my 52Mb hard drive more than 80Mb of space. :-)

I have always thought that if you double the CPU speed you would get
close to double the performance. Probably not exactly double as
everything else is still at 16MHz but surely more than 30-40% (~80%?) ?
Could you trade in your 16MHz 030 for a 32MHz 030 and stick that in instead?

Or am I just being really dense again? :)

The other way to speed things up a lot (so I am told ...) is to get fast
(TT) ram. What is the difference between TT ram and ST ram? For example
if I wanted to buy some, what would I ask for? (price?)
Presumably you need some kind of extra board to be able to fit this in a
stock Falcon? It would be too easy otherwise.
Any info on the Afterburner040 board?

Phil

There shouldn't be any trouble "converting" the files for the IBM, provided
that:

1. The files are Standard MIDI File (SMF) format.
2. The Soundblaster card/software will read SMFs.

To "convert" the files (no conversion really takes place), simply save them
on an IBM-formatted disk. The ST uses the same disk format as the IBM
(except for a few minor exceptions), so there should be no trouble.

Hi --

I have two Atari items for sale:

Slave Driver by Mind-over-Midi
Very good MIDI mapping software that allows all sorts of
MIDI data massaging as well as events (like program changes
and sequence playback) that can be triggered by other events

Specifically intended for live performance (can even use
your synth's display to avoid lugging the monitor!)

$125 obo (sells for about $250)

Atari monochrome monitor

$65 obo

For the past year or so, I've had a 100 MB hard drive sitting on my desk waiting to go in my megafile 30. The problem is, I have no idea what to do about formatting and partitioning the drive so that it will work with my ST system. The Atari HD utils that came with the Megafile won't allow me to format a 100 MB hard drive (the options only say 30 or 60 MB). Is there software available that will allow me to format and partition the drive? I'd hate to have to buy a box, power supply, and host adaptor when I've already got most of that in the Megafile.

Careful, Roger... your IQ is showing. I cannot answer for all Yanks, of course, only myself. Just as you cannot answer for all Kiwis.

>I HAVE NEVER EVER STATED THAT I ADVOCATED THEFT OF COPYRIGHT SOFTWARE,
>AND NO I DON'T HAVE ILLEGAL COPIES OF ROMS.....

Hmmm... then how do you explain the following comment from an earlier post:

In article dhq@golem.wcc.govt.nz, sheppard_r@ix.wcc.govt.nz (Roger Sheppard.), Subject: Re: WANTED dump 1.62;2.6;3.6 WANTED AJAX HD FDC, Dated: 23 Jul 1994 07:52:45 GMT, writes:

> A copy of a old TOS is not going to hurt any one at all [...]
> There are many many firms selling copies of TOS 1.4 and 2.06 in the UK and they
> are all illegal copies, I should know I had one of them...

I read this to mean that you had an illegal TOS ROM copy and thought nothing wrong of it. My apologies if that was not what you meant but how else should one take it? Software is software regardless of the medium its recorded on.

>Do you wish to have a slander suit taken against you...

Perhaps you meant 'libel,' not 'slander.' For example, in your last post you question me as being a 'dick head' or being 'stupid.' This is libelous as it is a written statement and defames my character or subjects me to ridicule. 'Slander' must usually be given verbally and be inurious to one's reputation.

>I do suguest that you go back to school and learn how to read, and a English
>school at that.......

Perhaps so. Unlike you, I obviously need to work on my spelling. :)

>Just because you could not handle a PC clone, it does not give you licence
>to slandering people that still have Ataries...

It's true that I sold my 486 out of frustration, but if you are inferring that I no longer own an Atari, that's incorrect. I still have a Falcon 030 and an old ST although I bemoan the rash sale of my trusty MSTE.

Like I said before... this is getting silly. Anything to add?

-Hutch- @ Fair Dinkum Tech

In the US you can sue anyone for whatever is on your mind. Gladly thats
not the case in Denmark or any other country i know of.
It's not that you can do this in Denmark, but most often you'll be told not
to, if the case is totally out of order and can be fix'd in another way.

>NeoDesk - a GEM desktop replacement (actually the first one ever)
>Geneva - Multitasking AES environment (AES 4.x compatible)

>

Well, I have to admit i have heard some about these program. I was actually
trying to order Geneva + Neodesk, but never got an reply. (long time ago
when you first arrived with Geneva plus Neodesk for a very low price when
bought together. I also remember something about it was suppose to be beta-
version of Geneva).
I still believe Neodesk is a good alternative to the desktop. Unfortunatly
I can't get it here in Denmark, (i think).

Thats not the way i've been tought copyright law.
I don't see anything wrong in a friend have his legal copy of some program
running on my machine while he isn't using it.
Also it's stated in the laws of copyright, that every user are free to do
a backup copy of their bought program. He just has to make sure the program
isn't run twice, (not even in a network), or he'll have to pay mutiple licent
to the author.

>If you are setting up one BBS, this is OK. But if you are setting up two
>BBS systems, this would not be legal. "Two" copies, "one" purchase.

Wrong. We both order a copy.

>Have you actually CONTACTED the author (you know, write a short note
>explaining your problem)? I'm sure that in the least the author would
>have NO problem in re-registering the program to your friend who wants to
>buy it (though after all the problems you had, your friend might not
>remain your friend too long ;-). As a developer, I hear stories like this
>quite a bit. Most times I am amazed how many people will not contact the
>author. I don't think we have a single customer who has come away unhappy
>after contacting us with a problem, regardless the problem.

I have tried allright. We even have two support BBS's here in europe, and
a networking area too. I wrote about my problems, ran into alot of problems
arguing with every other people in the area, but never heard a single note
from the author, (even though he's online, and sometime writes to others).
Another guy took over the support for the author, (cause he didn't have so
much time to be online answering), and now i'm trying to reach this guy,
but he claims everytime i write to him, (personal mail), that he never
receive any message from me.
My next step will be a direct call to his board, (probably cost me alot
of money, but they doesn't seem to care), as this seems like beeing the only
way i can make sure he gets my message.
I'll let you know the answer when i have one. Maybe i have screwed up so much
around this now, so they'll be happy to avoid me, by letting me sell this.

But still my point was around his rules, (which IS printed in the manual).
Why say you can't sell it or give it away, when it (maybe) is possible.

1520. Modem Purchase Help!

Newsgroup: comp.sys.atari.st
Date: 1994-08-01 20:28:58 UTC
From: clark@ee.ualberta.ca
Message-ID: <31jlua$arm@quartz.ucs.ualberta.ca>
Source record: 182865

Hi there,
Well the time has come for me to upgrade from my old 2400 baud
supramodem to something a bit more 'up to date', ie: at least
a 14.4 or maybe a 28.8.
I need HELP though.
I have a 1040Ste with 4meg, what is the maximum speed of modem
I can RELIABLY use? Do I need any special software other than
what I am using now (Storm 1.02), Do I need to upgrade any
chips on the computer itself (as in a 16550 for the PC),
and what are the GOOD modems out there that people have in
RELIABLE use on their Ste's NOW.
And what about FAX capability? Is there software for the Ste
to support FAX? If so, what is it, how much, and where.
Anything else I should know? If so, please help me out.
I nned it.

In fact, Starball was the program i'd refering to. I also want to registre,
(if it wasn't for a very annoying bug in it). And i also said it was no
excuse for not paying. Just mention one of the problems with shareware.

Will this new version also be able to accept a score of more than 100mill.
The version i tried didn't manage that. It sat my score for some randomize
number between 25-40mill when it ran above 100mill. This happened to me twice
in the same play.

As Gordie says, there are a number of well supported telecomm programs
available commercially. Flash II is one of those programs and if I may
put in a small plug for our product, I'd like to suggest that you check
out our demo.

Missionware Software continues to heavily support Flash II, currently in
version 2.2 and is working hard on releasing an all new version, 2.3,
which will go into beta test sometime soon.

Phillip Davey (Path) (pd@mole.bio.cam.ac.uk) wrote:

: I have always thought that if you double the CPU speed you would get
: close to double the performance. Probably not exactly double as
: everything else is still at 16MHz but surely more than 30-40% (~80%?) ?
: Could you trade in your 16MHz 030 for a 32MHz 030 and stick that in instead?

: Or am I just being really dense again? :)

: The other way to speed things up a lot (so I am told ...) is to get fast
: (TT) ram. What is the difference between TT ram and ST ram? For example
: if I wanted to buy some, what would I ask for? (price?)
: Presumably you need some kind of extra board to be able to fit this in a
: stock Falcon? It would be too easy otherwise.
: Any info on the Afterburner040 board?

I am not an expert on cpu speed, you should talk to someone like David Small. But, I start this discussion. In a perfect world if you double the clock speed, you double the performance. In reality ST ram has a nasty bottle neck where the speeds are limited. The cpu performs internal operations at the clock speed (16MHz or 32MHz) but when it comes time to access main memory the clock speed drops to the original 16MHz. (or 8MHz on a standard ST) So if your program only used internal operations it would run at 32MHz. (it would be a really boring program, BTW) But all programs use a combination of many cpu operations which average the clock speed to whatever you bench program shows. (30-40% or ~15% for Power Up as I've heard)

Now if you add a cache or use the internal one in the 68030, part of your program is loaded into the cpu like a ramdisk and it is executed at the accelerated clock speed, 32MHz in this case.

TT ram opens up the inherent bottle neck and allows the processor to access it at 32MHz. It is not the physical construction of the ram that makes it faster. The ram is the same as normal ST ram. It's *how* it is connected that makes it faster. TT ram means Thirty Two bits as opposed to ST (SixTeen). There is a grey area here where I hope someone will help me out. The TT ram must be connected to your computer with special hardware. Some accelerator boards have this hardware. Both Afterburner 040 by Overscan and Barracuda 040 by Wizztronics will have versions of an MMU(Memory Management Unit) which will accept TT ram. They are both due in August but hardware products are usually delayed several months.

I have probably made several mistakes so please correct me. :)

SUPER ATARI STacy DEAL!

The Atari STacy is a portable Mega ST with all the standard Atari ports plus a built in monochrome monitor.

At the recent Mid-Indiana ST AtariFest VI, an Atari 4/20 STacy with a special MIDI box and sequencing software was seen for sale at $1700.

The June 1994 Toad Computers flier advertises Atari 4/20 STacys for $1400.

I am selling my STacy for a price below either of these prices and you get so much more:

4 MB of memory
130 MB Maxtor HD
16 MHz AdSpeed CPU
Port for Mega ST keyboard (something no other STacy has)

Plus these items:

Joypad
Padded carry case (very nice)
External Mega STe keyboard (best keyboard ever made)

All for only $1000 plus S&H (US only, please).

Contact at (614) 262-2396 or jpoling@magnus.acs.ohio-state.edu

From: scotty@cais2.cais.com
Message-ID: <31kapp$p3t@sun.cais.com>
Source record: 182871

It arrived in the mail Saturday (July 30 for you calendar watchers).
It took me quite a while to figure out what it was. I had to poke it a
few times, then hold it up to the light with a magnifying glass.

Sure enough, the big, yellow (not green), TOAD COMPUTERS Product Catalog
was here! Priced at $3.00 yet, but they sent me mine because they like
me a Whole Lot (and because I've spent $$$ there annually).

After I came to, I began peeling back the cover, having some vague notion
that I would once again see what organized, feature-based advertising of
Atari products might look like. It's organized! It's fairly professional
looking! It describes available merchandise for the whole freakin' *ATARI*
line of computers!!

It also contains Dave's special sense of humor. "The Computer that Eats
Like a Meal." "Icebox Pie". Well, I don't want to give away the plot...

I may have to enshrine this thing. Uh oh--that'd require flat surface.

Get yours. Relive the dream. Show it to disbelieving friends!

1533. GNU C Help!

Newsgroup: comp.sys.atari.st
Date: 1994-08-02 03:44:17 UTC
From: hopper_t@msupa.pa.msu.edu
Message-ID: <31kfeh$12h8@msuinfo.cl.msu.edu>
Source record: 182874

Can someoen help me get GNU C up and running?

I've d-l'd all the necessary files, and even tried to compile a bit, but so far it isn't working. I would be very greatful if someone could email me some answers to the following:

Problem 1:

I'm working from within Gulam, with the following environment settings:
set path c:\bin,d:\bin

```
set env_style mw
setenv TEMP m:
setenv PATH e:\gnu\bin;e:\c;c:\programm.ing\alice
setenv GCCEXEC e:\gnu\bin\gcc-
setenv GNULIB e:\gnu\lib
setenv GNUINC e:\gnu\include
setenv GXXINC e:\gnu\g++-inc
setenv UNIXMODE 'd/brG'

alias cc e:\gnu\bin\gcc.ttp
alias ar e:\gnu\bin\gcc-ar.ttp
alias as e:\gnu\bin\gcc-as.ttp
alias ld e:\gnu\bin\gcc-ld.ttp
```

Now, when I take a C file with the following includes:
#include <osbind.h>
#include <stdio.h>
#include <string.h>
and run gcc, I get a lot of errors, the first calls a comment (which appears on the same line as code) an invalid escape sequence. After that, every form_* function is listed as being undefined.

Now, I'm used to working with the HSC 1.44 compiler, which automatically links aesfast, gemfast, etc. Do I need to explicitely include these in the compilation with GNU C? If so, is it easiest to use MAK files and make.ttp to do this?

Problem 2:

How do I get make.ttp to work correctly? So far, if I use the following MAK file:
CFLAGS = -O

LOADER.PRG: LOADER.C

I am told that no changes are needed, even though LOADER.PRG doesn't even exist! What am I doing wrong? Is there any good documentation on the GNU

implementation of MAKE?

Thanks for any and all replies!
Tom

From: sdenman@wolf.cs.washington.edu
Message-ID: <Ctw5H3.7Ct@beaver.cs.washington.edu>
Source record: 182877

Ok, here's the deal, many people have asked if I could support Brainstorm's DSP JPEG decoder in Speed of Light for Falcon030. The only problem is that it costs $100 for information on how to do it. Basically, I need to know if it is worth $100 to add this feature? Are there people out there who would register (and otherwise wouldn't) if I added Brainstom DSP support? If I get enough support on this matter, I'll definitely add it! As few as 4 people would do it for me (just enough to cover costs.)

Thanks for hearing me out, I really think this would be cool to add, I just need to know what other users think.

*** BTW, if anyone has a number I can call (besides Atari) to get the JPEG packet, let me know, thanks.

Also, I'll announce the release of SOL 3.5 in the next couple of days, so look for it. Cleaner JPEG loading (octree+dithering), faster filtering, incredible warping effects, and more bugs "zapped" than in a lightning storm. Full details later...

Probably you were refering to PFX which was distributed with an
earlier version of the Quester LHARC. The best thing about this was
you could use LHARC to uncompress them again without having to have
PFX itself around.

Self extracting archives are a pain - you can't look what's in before
extracting, plus they consume extra file space and download time due to the
build-in extractor routines.
Furthermore, they don't profit from new packer/depacker versions. If I
install a new lharc which runs twice as fast on my computer, the TOS archives
still depack with the old, slow speed.

Use ICD Utilities. When I cannibalized my Megafile 30, I did a bit of rewiring (replaced the power supply with a more powerful one, and got rid of the Megafile's fan) and plugged in a new 250 meg mech ... ICD will format it just fine. Atari's utilities became useless to me when I did this. I havn't tried AHDI 6.00, though, so I don't know if newer versions are better.

Source record: 182899

Well some corrections with the problems with CWACS the multible
archive converter..

It does not like the new LZH310, ok with LZH201l, the defaults
in LZH310 must be different..??

ARC does not store Folders, I new I had put my foot in it some ware,
what looks like folders is that DCX22B the Double Click archiver
can do what no otheres can't, it can extract multible ARC's in one Archive..

So when you extract a Archive that has other archives in side, they get
extracted at the same time, but they looked like folders the way
DCX displays them....

How do I get hold of the Author of LZH310, I can't find a thing in the Doc's..

May be he can help with the problems with LZH310 and CWACS....??

I would suggest getting ahold of the ICD PRO Utilities - it'll work with the host adaptor inside your Megafile, and is designed to work with a LOT of different SCSI drives. And it offers a number of great enhancements that will make your drive a joy to work with - caching, built-in fix for the 40-folder bug, etc.

... Intel inside. Idiot outside.

They did make some Atari Transputer Workstattions, but that was more like 7 years ago. The ATW had space for up to 13 transputers, and an video card which was advanced-for-its-time. It cost a lot more than UKP 600.

All the Zoom 14.4 modems I've seen don't have hardware based v.42bis or MNP 5; you need software that supports a special protocol for it. (Sorry, don't remember what the protocol was called). However, they are cheaper than the competition.

If the mouse ball has a sort of hard glazed appearance, try rubbing it
on a piece of carpet or scrubbing it with a toothbrush and rubbing alcohol.
If the ball is not slightly "grippy", it won't turn the rollers correctly.
Lots of folks clean the rollers, but forget the ball. Hope that helps.

You should be able to put the Canon into Epson LQ mode and use it
with an LQ-500 (or equivalent Epson 24 pin) driver. I imagine most software
packages support this emulation as it has been a popular one in the past.

| In <9407261428.AA04226@ilmen.lanl.gov> Hutch wrote :
|
| >If there are, in fact, UK firms selling unlicensed copies of Atari TOS ROMs,
| >then they are doing so illegally... and that's not just by U.S. laws!
| >
|
| Says who ??
|
| A little story from the real world.
| A company here in Denmark got the permission to translate Tos 2.06 to
| danish. In fact they got the permisson to do whatever they wanted with
| the Tos, just as long Atari Co. isn't responsible for anything around it.
| Now they'r translating the German Tos 2.06 to danish and sell it. They havn't
| got any licens to do it, they were just told by atari Co. that they really
| didn't care at all about their Tos.

Then they have a licence, which cost them nothing.

|
| Maybe this is illegal, but it sure did help that many people bought this
| Tos.
|
| Greets
| Kim

This is entirely rational behaviour on the part of Atari (for once :>). They "sell" one TOS per machine, and the after-market is so small as to be more of a nuisance than a source of income. If someone is willing to produce a specialised version for a niche market (like Denmark ;>), then Atari should be glad of the few extra machine sales this might generate. Just as long as nobody screws it up and then passes the result off as genuine Atari. I'm sure they'd let me do something similar if I just wrote and asked (and wrote again two months later, after reading here that the person I first wrote to had left, and finally sent a recorded-delivery letter to the effect that since they hadn't replied I'd just go ahead anyway... ;^>)

The situation with MS-DOS is rather different; when MS bring out a new bug-fix^H^H^H^H^H^H^Hupgrade, gazillions of people _must_ have it, and Bill Gates wants to make $1 on every one of them. In this case I suspect that the after-market is more lucrative than the market for first-time DOSses.

None of the above justifies unlicensed copying of anything whatever.

Now who'd like to start a grey market in pre-compiled MiNT 1.10's? 8-.

>get it to print out Pagestream files (among other problems)
> I would like some feedback from others who may have had or have heard
>of experiences with the gemulator

The first thing you (or your friend) must understand is that the Gemulator is, first and foremost, an _emulator_. As with all other emulators, there are tradeoffs and quite frequently you will find that all things considered, they are never quite as good as the 'real' thing. The Gemulator is a special product for a select group of people... Atarians who have moved to the PC but who still want _occasional_ access to their Atari software. If you really intend to do a lot of Atari work, then by all means, use a REAL Atari computer for that. After all, used Atari computers are dirt cheap now. The desk space they occupy is the biggest expense, IMHO.

The Gemulator works, but works well only with a very fast PC, IMHO. I would not want to use it on anything LESS than a 486-33DX, and much prefer to do so on a 486-66DX2 or 100-DX4. You need as much speed as you can get to keep things flowing smoothly under emulation. To be fair, this is very much due to the configuration of the specific PC, however. Your mileage may vary. :)

The Gemulator is currently a poor choice for games and was never intended to be used as such. No sound, no joystick support, and many games 'break the rules' by making direct hardware calls and thus won't run on a Gemulator.

The Gemulator is also a poor choice for MIDI since there is no support for MIDI ports. This may be corrected later on, however.

I don't know why your friend has trouble printing Pagestream files. I might guess that he does not have the latest version of the software. If he is using old version of the software, he is WAY behind the times and should upgrade immediately to the latest version... or else stop bitching. :)

If you or your friend have more detailed questions, the best bet is to go ask the author himself. Darek Mihocka is available via email at the address darek.m@microsoft.com or on GEnie at BRASOFT. He actively supports his products so contact him with your questions.

Cheers,

-Hutch- @ Fair Dinkum Tech

Eric S Johansson (esj@harvee.billerica.ma.us) wrote:
: is there any way I can replace my atari mouse with a PC trackball?

This might be possible as there is some software that allows operation of serial mice (i.e. PC mice) on Ataris. I saw that demonstrated at CeBIT 1993, as a means to get a real mouse on an ST book. If you could get a hold of this driver, you should be able to use any PC-mouse compatible pointing devices, they include trackballs of course. Other than that, you could check out Atari/Amiga products. Many third party mice and trackballs have a switch that allows to set them to Atari or Amiga mode, so check out stores that carry Amiga hardware (if you dare enter them ;-) . I, for one, have a trackball made by Alfa Data. Works quite well for me. I've also seen an even nicer trackball made by Marcus (I think), that one is really cool as the ball is heavy and runs with zest, somewhat reminiscent of my all-time favorite trackball, the one that was mounted in Atari's arcade game missile command...

To clarify what I think Rick Flashman really meant...

Copyright laws have nothing at all to do with you loaning (or selling) your
original software (including ALL copies, manuals, etc) to a friend as long
as you do not keep a copy while the other person is in possession of the
original (including hard disk installations). As intellectual property, it is
much the same as loaning a book to a friend (fortunately for book publishers,
it is much more difficult/expensive to copy a book than a floppy disk).

You should realize, however, that as the owner of the software YOU may be
held liable should your friend make an illegal copy of the loaned software!

Granted, certain software companies grant rather odd LICENSING rights that
severely limit what you may or may not do with the software, but those vary
widely and are really catch-as-catch-can as far as their reasonableness is
concerned. Most agreements have back come down to earth, fortunately.

At least I THINK that's what Rick meant. ;-)

Hi,

Can anyone shed any light on the cheapest way to attach a HD to my ST ?
What do I need apart from the HD ? Can I use IDE drives or what ?

Cheers.

What's this? Last I checked you could use PC Bus mice/trackballs, but the
serial mice were out of the question. If anyone knows anything about this
driver, please let me know! I'm in need of a new mouse, and I've found a
cheap PC serial mouse I like...

The license EXPANDS upon the "copy" rights. Without a license, you can do
almost nothing without permission from the author. Not the other way around.

You can give software as a present or sell it second hand, but you CAN'T
then keep a copy! That would be piracy. Think about it, you are creating
two copies from one original.

In my opinion, you don't even have to ask, (which ofcouse is against the
laws of copyright). But as long as you, like you said, don't screw up
anything, my guess is, that everybody is pleased.
On the other hand, it wouldn't hurt to ask before doing anything.

1576. Atari/Amiga Article in EM

Newsgroup: comp.sys.atari.st
Date: 1994-08-02 19:57:24 UTC
From: none
Message-ID: <none-020894135724@beethoven.la.utk.edu>
Source record: 182821

Did anyone catch the article on the status of the Atari (Falcon) and Amiga platforms in the August '94 edition of Electronic Musician ("The Handwriting on the Wall" by Michael Brown)? To my eyes, it's one of the most pragmatic, non-Mac/IBM-biased articles I've seen in a long time. Michael Brown, instead of trashing both systems, gives an insightfully truthful state-of-these-computers report. Anybody else see the article and have any comments? (We just received our issue here at the UT Music Library, so I imagine that everybody else has had it for 30 days or so).

Eric White (wewhite@utkvx.utk.edu)
University of Tennessee

I thought it was "on target" as well. The one thing I missed in the article though, is the positive side of the computers. If someone wanted to get into sequencing, the can purchase a used 1040 for $100 - $200 (which includes a monitor, floppy drive, CPU, and MIDI interface), and pick up a decent sequencer for quite a bit less than getting a Mac or Windows system.

Granted, the buyer won't have direct to HD recording, and all of the fancy new DSP stuff, but the way I see it, Stienberg, Cu-base, Dr. T's, and Hybrid Arts/Big Foot sequencers were great a few years ago, why aren't they just as good now?

Rob S. Rice (rrice@netnews.upenn.edu) wrote:

: I've cleaned the mouse twice in the last week, and yesterday I
: took my foam-rubber mouse pad and washed it in the sink with
: detergent. That didn't help. It might be my perspiration
: flowing down from my hand, or...? Does anyone have a suggestion
: as to what might help?

It depends on whether the ball itself slips on the mouse pad, or
the ball moves, but slips on the axles inside the mouse. In the
former case, you might try wrapping your mouse pad into a dish towel
or a piece of table cloth or whatever, any fabric piece that is
reasonably smooth but does not become slippery when getting wet
could work.
If the ball slips on the axles, you could try opening the mouse
and lubricate the axles. The problem here is that (1) grease can
damage the plastic bearings of the axles and (2) that you have to
take care not to lubricate the parts that make contact with the
mouse ball -- these you want to have as much friction as possible.
Lubricants that don't (likely don't, at least) harm the plastic are
(a) graphite, (b) soap and (c) candle wax. Use small screwdrivers like
those used to disassemble glasses to apply lubricants to the bearings
as precisely as possible.
You can also try to make the surfaces of the axles a bit rougher
with fine-grained emery paper.

ob.disclaimer: I've used all the techniques with the exception of
candle wax, with reasonable, more or less long lasting results and
without butchering a mouse. If your's dies from a treatment I suggested
though, that's not my fault...

James Grunke at Atari didn't like it too much...

Category 30, Topic 6
Message 157 Thu Jul 07, 1994
JAMES-GRUNKE [James] at 23:41 EDT

Well Folks, It looks as though Electronic Musician will be printing a pretty harsh scoop on Atari in an upcoming issue. They did an article on Commodore and Atari despite my protests that putting Atari in that article is an unfair association. I asked the publisher to do a seperate article on Atari but he declined, hence, it will go to print.

I've always liked EM and respected their editorial work, but I find this article reckless to the concerns of the developers, dealers, and end users who are professionals within the Atari community. I am interested in your comments after you read the issue.

I am looking forward to "Future Falcons," and you will hear about them first on GEnie. Thanks for your support.

Check out a ZyXEL they are the best you can get for a cheap modem,
a lot of other cheap modems use the Rockwell chip set (Supra/Zoom), and don't
work to well..

There are Modem reports in a lot of PC mags worth having a look at, one that
comes to mind is the May PC Digest...

THE STORM only supports modem port 1 and from memory STORMS fastest speed
is 19.2, so no mods needed there, with a 14.4 modem, you would not get any
faster speed with a 28.8 modem, as the input port speed is limited to
19.2 bps......

Hayes did a article in comp.dcomp.modems a few weeks back, stating to hold of on
buying 28.8 V34 modems for at least 6 months, the reason was so that the bug
can be ironed out..

Some V.FAST 28.8 modems can't be updated to V34...

There is a Mod RSVE that changes the lower baud rates to up to 112k bps, but
THE STORM does not support these high rates, but the German program Connect
does, the main problem with this mod is you need to get a GAL programed..

1582. ATARI 1040ST WORD PROCESSOR

Newsgroup: comp.sys.atari.st
Date: 1994-08-03 01:11:36 UTC
From: contardo@pilot.njin.net
Message-ID: <Aug.2.21.11.35.1994.14410@pilot.njin.net>
Source record: 182825

A co-worker as asked me to ask what word processor(s) are available for the 1040ST system. These system are currently part of a network, but that network is being discontinued. It is hoped that the computers can be used as stand-alone systems in various schools. Is there an Atari Works program, as there is an Apple Works, Microsoft Works, and Claris Works? If so, this might be one solution.

Any comments or suggestions would be greatly appreciated.

Clem C

From: mparrott@connected.com
Message-ID: <31mvea$sic@hebron.connected.com>
Source record: 182828

You probably won't find a specific driver for the BJ-200e for either

WordPerfect or PageStream. WP stopped Atari development long ago; I
recommend you experiment with different Epson 24-pin drivers, with the
200e in Epson mode. You should find one that will work properly.

PageStream has a few BJ-specific drivers; you might try the BJ-10 driver,
or again, put the printer in Epson mode and try any of the Epson 24-pin
drivers.DO NOT count on Soft Logik to write a specific driver for the
200e! They
have stated on their BBS that they "will not be writing any more 2.2
drivers."
This is particularly frustrating for BJC-600 users, as their LQ-2550C driver
doesn't work as well as the printer is capable of performing.

Hope this helps...

1589. Atari ST comm programs?

Newsgroup: comp.sys.atari.st
Date: 1994-08-03 05:04:32 UTC
From: ue364@freenet.Victoria.BC.CA
Message-ID: <1994Aug3.050432.1822@freenet.victoria.bc.ca>
Source record: 182847

Hi a friend of mine has on Atari ST and is looking at getting on the internet. However he doesn't how a comm program, getting an ext modem is easy , but the software isn't. Is there an FTP site for Atari ST programs? Also is there a really good comm program, thats easy for a beginner to use? If you could e-mail me that would be great as I'm not always able to read this group. Thanks!

James

Message-ID: <1994Aug3.074306.10560@ericsson.se>
Source record: 182835

Hello,

Is there anybody out there who has any experience with connecting
a NEC CD-ROM drive to an ATARI ??. The drive in question is a
NEC CDR 210. My question is, will it work together with Metados ??
And if I want to play audio cd's, will this work as well ??

Thanx in advance
Rob

I think you need to get hold of an Atari of the Unix tool "pathalias".
It writes a file in the correct format. The docs that go with this
will help in setting it up also.

Mail me if you can't find a copy.

1598. Re: Graphics/Samples Ripper Programs?

Newsgroup: comp.sys.atari.st
Date: 1994-08-03 08:17:29 UTC
From: diehl@io.org
Message-ID: <31njqp$97p@ionews.io.org>
Source record: 182842

There are three music rippers that I've been able to come across: Crackin' Musexx II, which will rip MODs from files, or chip music from files or memory (has a reset ripper for chip music, but not for MODs), Probe ST, which will rip anything, but mostly MODs, chip music and graphics, and last but not least, Mega Ripper, which does graphics and several types of MODs.

Of these, only Probe ST is able to rip things from RAM, and comes with a reset program to split your RAM in half so that when you reset, RAM is copied into the second half of your RAM so that it's not overwritten when you reboot and load up Probe ST. None of these will work ripping things from demos because most demos steal the reset vector for their own purposes (either for a reset demo or just to purge RAM) and Probe ST's reset program isn't smart enough to steal it back.

THere are a few hardware rippers available, too ... such as the Discovery cartrige (I believe that was done by The Lost Boys) adn The Ultimate Ripper, which you have to build yourself. (The docs tell you how, and come with the ROM images to burn into the chips)

Unfortunately, I don't know where any of these might be found, but at least now you know what to look for. :-)

Yes, there is an Atari Works program The WP is good but the Spreadsheet & database are average at best. Other good ones to consider are Papyrus, That's Write 3 and Protext, the latter isn't GEM based but is very fast and well specified.

You can either buy an ST specific HD or buy a SCSI drive for a MAc or whatever
and buy an ICD link to connect it to the ST. I think there is an IDE adaptor out
or out very soon. One is on the way at least. In the UK you can buy complete ST
hard drives for a little under 200GBP.

1602. Neodesk 3 and TEX

Newsgroup: comp.sys.atari.st
Date: 1994-08-03 09:13:37 UTC
From: kaps3@central.susx.ac.uk
Message-ID: <31nn41$rdo@infa.central.susx.ac.uk>
Source record: 182843

Cs-TeX 4 runs fine under the normal Tos 1.6 Desktop.

If run under Neodesk 3, after texing a document, or some such operation,
i get a 'stack space exhausted' message and a system crash.

If run under Neodesk 3 and Geneva, everything works fine except every
operation is run twice - once on the root window and once in the
'tos-in-a-window' window.

Cs-TeX is a great piece of software, output is excellent, but there do
seem to be some incompatibilities with these newer bits of software.

Anyone got any ideas???

Thanks, Steven

There's probably a way to do it with Atari's utils, but I've never liked using them... I would recommend dropping $40 and getting the ICD PRO Utilities, which does not require an ICD host adapter and allows you to do just about anything you need to with a hard drive, including formatting and partitioning MFM and RLL drives provided you know the number of cylinders and heads the drive uses (this should be stamped, stickered or printed on the drive mechanism somewhere).

I recently formatted a 120 Mb RLL drive with their Link version software, and it worked like a champ - even let me us BGM partitioning for larger partition sizes. ICD's stuff is hard to beat...

The extra time is negligable for archives that large. And of course you can look into them. Try unzip -v gmn19999.tos on a Unix box.

There are lots of excellent word processors, data bases, etc. for the
Atari. If you have 2Mb RAM, then AtariWorks + SpeedoGDOS might be just the
thing you're looking for. Call up TOAD Computers at 1(800)448-TOAD; they
can help you out, and you can get their new 52 page product catalog, most
of which is software for the ST/STE/TT030/Falcon030 computers.

From: f91-men@alv.nada.kth.se
Message-ID: <31o7qa$nu9@news.kth.se>
Source record: 182755

Does anyone have an editor suitable for Lisp/Scheme code? Counting parentheses
is a must, lisp-sensitive indentation would be nice. An editor which can be
programmed to do either is fine, too. Since I am constrained to an
old 1 meg ST with no hard disk, GNU emacs isn't the answer :-(.

Many thanks in advance (I hope)!

1613. Poor Atari Archives = Lazy ST Owners?

Newsgroup: comp.sys.atari.st
Date: 1994-08-03 14:23:13 UTC
From: aw369@freenet.hsc.colorado.edu
Message-ID: <199408031422.IAA13646@Freenet.HSC.Colorado.EDU>
Source record: 182756

What is it with the ST softwarearchives?
The only one which is even half good is the umich archive, and even that could do with a lot more stuff. Half of the games and new programs advertised in
PD library ads in ST Format are nowhere to be seen on the net, WHY?

Top games like the Grandad adventures and walls of illusion are just ignored and no-one seems to complain! Is it just that Atari users are too lazy to upload any new stuff they get? Compared to the MS-DOS games archives, the ST archives are tiny!!

Before people start flaming me, I'm not having a go at anyone in particular, I'm just trying to raise a little interest in whats going on. As a gesture of good will I'm going to grab a fistful of ST stuff and upload it to an archive or two. I hope others will follow my example, I'm fed up of downloading 5 year old versions of Tetris!!

Just my #0.02 worth....

Blood.

Have you tried writing a letter (on paper)? It's quite cheap and usually
works best for developers that are hard to reach online.

Maybe I'm being dense or something. What do you mean by "crack it"? I have
no idea what this means. If it was a copy protected program, I would guess
that means to remove the copy protection. Otherwise, I have no clue.
Convert the exectable back into assembler? Can you clarify, please?

I'm not sure what the current retail price is of the Gemulator and I don't have Toad's excellent new catalog in front of me. I think the price has dropped to around US$149 or something like that.

But you can send email to Darek Mihocka (Gemulator's author) at darekm@microsoft.com and he'll be happy to answer your questions and let you know where US and overseas suppliers are located.

Towers just got an 80% in ST Format (august issue). It is a tryware RPG available from PD houses, online services, and is FTPable from several sites. Towers ver 1.4 even supports two player null-modem connection and Modem play with 14.4k modems or better. (you need more than one meg of RAM to play the two player option.) It is a good game and worth the try.

I know what you mean. It get's frustrating to read about interesting programs in the europress mags only to find out that the only hope of getting a copy is to wait for 6-9 weeks to get it shipped to you by mail. It would be nice to see some more stuff out of germany up on the net. I know that there isn't as much coming out as there used to be, but you still hear about programs that just don't seem to be available on the net. And what's the story with France? I mean there seem to be several houses still programming for the atari there, Brainstorm, Loricels etc., but the amount of shareware that comes out onto the net from there is small. Do all french programmers work for professional houses ? ;)

Well enough of my rambling.

_If_ you know which archiver was used to create it. Before you told us,
how would the user have known that this was a self-extracting zip
archive as opposed to, say, an AFX archive or something more exotic?
With a non-self-extracting archive, you can tell from the filename.

Someone who never wants MiNT 1.11 to see the light of day.

I'm serious about the MiNT 1.10 copyright. So is Atari.
Unauthorized distribution of MiNT 1.10 binaries is piracy, pure and
simple. There's nothing "grey" about it.

I hope that the next version of MiNT will have much more liberal
licensing terms. But unless the terms of MiNT 1.10 are respected,
that is unlikely to happen.
--
Eric R. Smith ersmith@netcom.com
No, I don't know when MiNT 1.11 will be released. Soon after I find
enough time to finish it, I would guess...

I think alot of those UK games are Licenseware and are only available on
disk. Part of the purchase price goes to the author instead if sending in
the registration fee afterwards. The fees are still in the ballpark of
shareware but you don't get to try before you buy. It basically keeps
honest people honest.

Sam

PS I bet if you find some shareware authors and send them some e-mail
they may send you a beta version of some game or new project they're
working on. It doesn't hurt to send them a pre-shareware fee and
complement them on there past programs. :)

etc., etc.

Well, I'd like to say that I'm surprised, but although I like James (read his articles on STs and MIDI for years in the Atari mags), he *does* work for Atari Corp. I think he was probably insulted that anyone would lump Atari in with Commodore. (Gee, James, how's it feel to be in the real world for a change?) Seems to me that the only current difference between Commodore and Atari is the fact that Atari--at least as of today--is more or less solvent.

I used to be a tried and true ST-or-die user. I edited the local user group newsletter, did MIDI/ST demos, and attended Atari cons whenever finances and scheduling allowed. I still love my ST. Cubase is so easy to use and so powerful I doubt I'll ever have to buy another sequencer. But the day is coming when I see myself plopping down the bucks on a Mac or PC, simply because I no longer have any faith in the company that made my computer. Imagine General Motors announcing, "We're going to stop make automobiles, and just make go-carts. We'll still sell some cars, but right now all our resources are pointed toward the recreational go-cart. Besides, there are plenty of companies making car parts for our vehicles."

[Eric steps down off his soapbox.]

Anyway, I think James hadn't really seen the article. And as press coverage goes, the article falls into the category, "Any news that ain't bad is good!"

>: DH>Self extracting TOS acrchives are much nicer. Saves all that tedious

>: DH>looking around for the correct archiver, I wish all archives were self

>: DH>extracting.

Haven't you guys ever heard of installing as application? All I do is double
click on a zip,arc or lzh file and the appropiate utility starts with my file
already load and ready to extract! With a tos extension I have to do a trial
and error to find which one it was packed with! This is stupid! We aren't all
brain dead and helpless!
Just my 2 cents worth!

I've bought a Practical Peripherals 14.4 fax/modem that supports v42bis as well as some other great data compression and error checking protocols and when connected to a modem that also supports this I'm able to connet at upto 58,600.

As for Faxing it works great, I have a 1040st (no e) and a copy of STraightFax, (cost around $100) and it works just fine.

The modem I bought for $110 at Fry's Electronics it's the PM14400fmxt mini tower. Last time I saw them listed though, they were about $135. So for around $240 you can get set up and be ready to fax.

I've got a Spectre 128 (not GCR) with 128K Roms that I could sell, but I've got no idea what this kind of package is bringing these days. If it is too little, then I'll probably just hold on to these things, but let's see:

Spectre 128 with 128K Mac Roms. I've got version 3.0 software, along with manual and earlier software versions, manuals, and newsletters.

MagicSac with 64K Mac Roms for a much earlier-Mac emulation. I think the software I have for this is the last version, or next to last.

Translator One (I've got two of them). This allows your ST to read Mac disks directly in Mac mode. It is very very slow, but at least it works. You hook this thing to your ST via the MIDI port with MIDI cables, which you'll have to supply yourself.

If you're interested, send me an offer.

Rick - so you're taking over Barefoot Software - AND you're interested in re-issuing MIDImaze? YES!

I was able to find a (used) copy of MIDImaze last year, and have been having fun with it ever since. I'd LOVE to be able to get a backup disk, or at least have the original version of MIDImaze so it is hard drive installable.

Heck, an updated '90s version of MIDImaze (complete with a solo adventure mode for practice, something MIDImaze II sorely lacked) that could take advantage of the Falcon's architecture would be AWESOME! (Hey, if you could update it for the Jaguar, that'd be just as awesome......)

Hello

I would like to engage in a little mental excercise here.

If Atari were to attempt to re-enter the Personal Computer market in a meaningful way, how should they do it?

What type of platform and architecture should a new design follow? CPU type? Bus architecture?

What type of OS (personal choice here would be a Mach based system that would look like NeXT: NeXT Lite?)? Should there be a TOS compatibility layer?

Anyway, just interested in what people think

Thanx

IIRC there's about 5 Atari HD virii in existance. There's been Beilstein (sp?)
quite recently which is really bad news, like it's got a random mutation so
looks different _every_ time. Oh yeah it's got 600,000 or something like that
mutations! Not sure if it attacks HDs.

a) Try your most favourite decompression programs. The one which uncompresses without error is probably the right one :-)

b) Have a look at the compressed file with od or another tool which can dump the code (e.g. a disk monitor). Most compression programs tend to write some information in a header in order to provide information about the compression method.

c) I don't know if file gmn19999.tos on a Unix box might work?

You can't exit the game. And at the moment it doesn't save the high scores. The 'leave game' option (which was supposed to be hidden) is only there in case I am testing the run version and I need it to activate the debugger. The reason for not allowing it to exit the game is that I wouldn't trust system integrity after it had been running. I have enough trouble exiting cleanly in the JPEG viewer and that is totally O/S and memory legal... so Starball (which isn't) I would trust about as far as I could comfortably spit a rat.

Source record: 182792

Iain.Laskey@barclays.co.uk wrote:
: I went to a UK Atari show yesterday. It wasn't particularly large but what and
: who were there was good. I finally got to see a Medusa running. Very nice,
: complete with 105Mb Syquest and other bits. It looked seriously fast. The New ST
: Emulator for PCs, Janus was also on show. This too looked impressive although I
: suspect the UK price will be a little too high for my pocket.
: There were 2 different colour digitisers, some cheap TTs and Stacys(!), That's
: Write 3, the new Speedo 5 and lots of bargains. Nearly every stand was armed with
: Falcons with a few TTs. Calamus SL and other such heavyweights were being demoed
: to good effect.
I went to the same London Atari show....and boy, was I impressed! It
was in a smaller space than the Gasteiner one a few eeks ago....but was
much better.....

As I do UK support for some foreign Shareware programs, I received a
few shareware fees, and i also regsitered for shareware while there.

I also got to meet all the guys who I've known from the net. Joe
Connor, Graeme Rutt, and Vic Lennard. I now write some for Vic and ST
Review, and so it was good to meet these guys.

Karl gave me a very good Demo of the Medusa....and I just fell in love
with it. It's a really good machine...and fast....

David Encill from Titan gave me a demo of APEX Media...the image
processing program, but Dextrous was still not to be seen. 8(

One thing surprised me.....HiSoft were not there....

Another thing surprised me...Best Electronics were there....

I got my Key Clicks from them....a 15 minute job, and my keyboard feels
a lot better.

Overall, a very good show.....there was no stuff like PCs are better
than Ataris, etc. The whole plave was full of Ataris....and so many
people.....you wouldn't normally realise that so many people have an
Atari. I was there with leaflets about my User Group (a new one just
formed), and i got responses from these.

Who said the Atari market is dead?

: never had a problem with it.

: directory /packages/atari/umich. I don't know whether or where this
: particular file is on Hensa.

Sorry to disappoint you, but I haven't got round to installing many MiNT packages on HENSA, yet. I still have to recover the backlog of file that didn't appear on HENSA, since the Atari section was neglected for a very long time. I also have to keep up with new files appearing, and and and....

But I promise you....loads and loads of backlog files, as well as new ones will be appearing on hensa.....

Back to the point.....

The tools index for Atari, has IMHO, got the latest tools for archiving, etc. I have also put them all in self extracting TOS format. Zoo 2.1 is the latest version that I know about.

you want the file:

micros/atari/tos/tools/zoo21.tos

This is the full version, and comes with all the necessary docs. If you have any problems, then mail me, and I'll try and help.....I've used this program like anything.

Oh, file size: 89500

Hope this helps.

Oh, and Scott.....know what's happening about the Heat n Serve mailing list? Is it coming back?

Dan.

Well, this is not completely true. Most self-extracting archives on the
Atari though are either based on ZIP archives or LZH archives. Both
STZIP and LHarc allow you to load and treat them just like any other
type of archive.

Cheers,
John

> it was no excuse for not paying. Just mention one of the problems with
> shareware.

Indeed, it is an inherent problem, I suppose, with Shareware, in that to get the program, or at the very least to send money for it, you must send your dosh to wherever the author lives (r the PD library he/she deals through, which would likely be near where they live as to make no difference anyway). Generally, this can often get costly. But I figure that even with exchange rates as they are and the cost of mailing a money order or cheque or somesuch to that person, it still comes out cheaper than if the program were commercial and you bought it from a store, so it is still a deal.

Especially where Starball is concerned. Five quid is far more than reasonable IMHO for such a quality game.

> Maybe someone could help you. at least it's worth a try.

One of my beta testers has a Falcon030 w/ TOS 4.02 and 4 megs. However what is required to get Fansi to work perfectly on a Falcon in 640x480 would require me commandeering his machine several hours a day for several weeks. By that time, I think, he'd likely be sick of the sight of me. :-)

Why should i need to do that, just tell me. This guy got several support BBS's which should port all information to him. He also is online at the same net as i am, (in the same area also). Just give me one good reason to write him snail-mail then. And what would i gain. If he ignores my echomail and netmail, why shouldn't he just ignore my snail-mail then. (I'm not sayin thats what he's doing, but since i don't get any answers i can't tell).

As far as i know, it do means that the pirate will remove any copyprotection
from the original disk, so they'll able to spred more copies without any
limit's. Also key's and codes are beeing changed so the user can use the
software without any limits, as bought.

>layer?
>
>Anyway, just interested in what people think

Well, I am not expert, but here is what I think.

1. Atari should concentrate on the Jag. When (if) Atari becomes fat from
fees from game makes, then look at computers again.
2. They should look at a hybrid of the Jag and the ST. Try to reinvent the
concept of the home computer or the HC. Atari will never be able to
compete in the PC market.
3. The market(s) they should aim for:
a. people who want to get a computer but don't want to spend $1000.
b. Present atari loyalist
c. People who want to get they kids a computer but don't want to
spend $1000 for a toy
4. The system: 68k based, compact case, rfmodulator and rgb, 3.5 floppy,
cdrom. It should be ST TOS compatible and atlest run JAG cds. The cost
should be under $500.
5. advertise!

Binary Sounds
ANNOUNCES !!!
We have taken over the marketing and distribution and support of The
MidiTrack ST Series (Smpte/Edit/EasyTrack), GenEdit, EZ-Score and MidiMaze
of Hybrid-Arts Fame. Stefan Daystrom will continue support and upgrading
of the MidiTrack ST Sequencers. We are also lowering prices to make
our products some of the best values for the amateur, semi-pro and
pro musician!

List prices are as follows , in addition we are offering special
pricing thru Oct-31-1994 as an incentive to get to know us.Demo's
will be available on Genie, Delphi and Compuserve as well as the
Midiworld BBS and other fine BBS's in your neighborhood!

SmpteTrack Platinum 7.1 W/SMPTEmate Plus...To be announced Soon!

EditTrack Platinum 7.1...List $149.95...Special $ 99.95

EditTrack/SmpteTrack Upgrades to Platinum 7.1 (software and manuals only)
From Gold 6.xx ....List $ 70.00
From before 6.xx.........List $ 95.00

EditTrack Gold...........List $ 89.95...Special $ 59.95

EasyTrack................List $ 24.95...Special $ 19.95

GenEdit 2.0..............List $124.95...Special $ 99.95

EZ-Score Plus............To be Announced Soon!!

MidiMaze.................List $ 24.95...Special $ 19.95...2 for $35.00

All prices are in U.S. Dollars plus shipping and handling.

For all those Platinum user who received Gold Manuals with addendums
we now have Platinum Manuals available for $18.95 plus shipping.

Binary Sounds is operated by:
Rick Ladage and Bob Semaan in Houston, TX. USA
We can be reach by E-mail or snailmail or tele or fax!

Rick Ladage
Genie...R.Ladage
Delphi...Bondservant
Internet...bondservant@delphi.com

Source record: 182557

yes, there IS an Atari Works - made by Atari themselves. It comes with a word processor, database, and a spreadsheet. There are a few problems, though, in that it requires at least 2 megabytes to run properly, AND it suffers from a printing problem called "Black Page Syndrome" (the latest version anyway).

Others you may want to consider:

First Word Plus (venerable word processor, rock solid with a LOT of nice features - however, GST Software has just told their ST clients to take a flying leap in regards to support, since they have bigger fish to fry (IBM))

That's Write 3 (by Compo Software, really nice, lots of features, and you can use Bitstream's SPEEDO fonts with it. Compo right now is probably the BEST company with support for their products word-processor wise)

Protext 6 (the choice of a lot of European users)

Marcel 2.34 (a shareware offering, looks pretty powerful)

dB Writer (a FREEWARE word processor that also has a lot of great editing/formatting/layout features.

... In the space ship, the silver spaceship, the lion waves goodbye

>
>Sagrotan . Has extensive HD virus library facility's including Link virus's

Anyone know if there's an english version floating around? I've come
across Sagrotan before, but not being fluent in German it's of little use
to me.

BTW, I mentioned Protect6 a while back as an excellent shareware solution,
but I thought I'd add Ultimate Virus Killer v6 (UVK6) to the list. This
is supposed to be the best virus detector/killer package available for the
ST/STe/TT/Falcon computers, and can even recognize the new and virtually
undetectable "Beilstein" virus. It's listed as US$29.95 in the new TOAD
catalog. For the best protection, this may be the way to go. ST Format
has a demo on the cover disk of issue 57, along with a fully working
version of Protect6.

Thanks,
Tom

Agreed on all three (six) points. I've come across a number of people who buy computers rather than TVs or game consols for their kids; the kids can still play games, especially with CD, but it also becomes a learning tool. This sort of market might be a good place for Atari to look in to in the future. The only problem: they would need some really good software for games, education, and productivity, and that software would have to be supported for several years.

>4. The system: 68k based, compact case, rfmodulator and rgb, 3.5 floppy,
> cdrom. It should be ST TOS compatible and atlest run JAG cds. The cost
> should be under $500.

I agree with rfmofulator, RGB, and 3.5" HD floppy. CDROM should be an option ($200+-), it should be in a TT (MegaSTE) case, to allow for third-party upgrades/enhancements/emulators/etc. The chipset should not be 68k; within a couple of years that chip will probably be available in only limited quantities anyway. Perhaps a low-end PowerPC chip (maybe 603?), assuming it takes Atari a couple of years to get back in the swing of things.

Say $900 - $1100 for a system packaged with monitor and software (say Atariworks, breakout, and a graphing ProCalc) in a 4/150 or maybe 8/150 configuration.

It should also have true color capabilities, not less than 8-bit stereo sound, and a true multitasking, windowed OS.

>5. advertise!

If Atari had done some real advertising in the past five years, they probably would still be making Falcons, so I think Atari management should be tied down and forced to listen to that statement for a couple of days. :-)

FWIW,
Tom

I have a Seagate ST-157A drive and would like to use it with my
520ST (1meg). I have read various postings and faq's about
adapting drives to the ST, but seem to have missed any info on
the IDE drives. About a month back there was some info in a
posting about someone working on adapting IDE drives. Is there
any info available on how to do it?
Thanks for any help.

Greetings Atarists.. Im "desparately seeking" a copy of a German PD
program called K4 Soundrobot. It is an Editor/Librarian for the Kawai
K4 synthesiser. It was mentioned in my last issue of ST Applications but
I've had no luck at all so far in finding it. If anyone knows of an
anonymous FTP site which has it or if some kind soul could uuencode and mail
me a copy I will personally burst all over them with gratitude ahem....

Thanks in advance.

>configuration.

But then your talking about a PC again. If the complete system is ~$899,
People will buy a cheap intel box runing dos/windows/hack of two. Atari's
only hope is the reinvent the home computer market. I can see the point
about the TT case. As for the chip set, I don't think PowerPC is the way to
go. First off, it will become instantly incompatable with all existing
st software. Atari can't do that. They did that with their 8bit line and
it cost them dearly. A million users isn't anything in the pc world, but
a million advocates is a good starter base. But lets face it, for the most
part, the pentium and the powerpc were created souly to run software
kludges that existed back in 83-85 after and to allow multi-tasking.
Basically, to cut to the bone, its to allow GUI multimedia games on
systems that barely can keep themselves running. I just feel that a 68k
based ST with the Jag chip set could make games that bounce all over PC
games. As for applications, there is already descent applications for the
ST. I'm sure that will enough units, they could be updated to satisfy any
home computer user. The CDrom is very important. They can be made for
about $40. They aren't a huge added cost if the computer has one built in.
The idea is that the programs would mostly run from the CD rom and store
data on floppy. This solves the ever shrinking HD space problems.

>It should also have true color capabilities, not less than 8-bit stereo
>sound, and a true multitasking, windowed OS.
>
>>5. advertise!

I guess. The ST has a GUI os. Whether is should be multi-tasking or not
should be optional. Lack of multi-tasking hasn't hurt the PC one bit.
(and I don't feel that windows multi-task). As for True color and 8 bit
stereo, doesn't the Jag chip set have that?

The thing with these "licensing" agreements that you see on certain packages is that nobody actually reads them! Well, I don't for a start. It's all legal gibberish and makes very boring reading - even if you can understand all its nuances. :)

> At least I THINK that's what Rick meant. ;-)

Yes, he's clarified it up himself... It's just the way he originally phrased it had me thinking of something else! :)

|> Saw an article in ST Format, I believel, that showed the Furst ltd. product
|> SMS2 that seems great. Hope you've seen it. What do you know/think/speculate?

I _know_ that it's an alternative operating system to TOS
and is compatable with: QDOS, Minerva, SMSQ and Argos.
I also know that it's also available from another company
(Merz) in Germany, though whether they and Furst provide
the same product or different implementations of SMS2
I don't know.

I also know that many people say they have seen and/or
used the Furst SMS2, so it isn't vapourware.

I _think_ SMS2 (from experience of similar OSes and
having read an awful lot about SMS2) is one hell of
a lot better than TOS and even nicer than system 7 on
my applemac or windows on a pc.

I _speculate_ that someone is going to start up a magazine
for SMS2 computers in Europe soon, and it might even be
me...

I _enquire_ whether you saw an advert or a review, since
if it has been properly reviewed in the ST press I want
to read what they had to say about it!

Hello

I would like to engage in a little mental excercise here.

If Atari were to attempt to re-enter the Personal Computer market in a meaningful way, how should they do it?

What type of platform and architecture should a new design follow? CPU type? Bus architecture?

What type of OS (personal choice here would be a Mach based system that would look like NeXT: NeXT Lite?)? Should there be a TOS compatibility layer?

Anyway, just interested in what people think

I think they should get out of the Personal Computer hardward business an just port thier software to a PREP complient architecture. The PowerPC is fast enough to emulate a 68K faster than most Atari STs. If you could sell the system software for $150 or less then parents probably wouldn't mind buying this for the kids if they have already got the PREP machine to run OS/2 (or whatever) for themselves. If enough games and home user programs worked under emulation this would support enough of a startup market. The next step would be to develop PPC native apps that took full advantage of the hardware. All of this is assuming that lots of companies start producing PREP complient machines so that prices are driven as low as possible.

Brad

1693. STE Dallas Clock Driver needed

I think Atari needs to upgrade their hardware like they did when they switched from the 8-bit to the ST. The hardware must be so advanced that people will buy it because it's radically powerful. Of course it would be backwards compatible with the ST in emulation mode. Atari can't compete with PC's in there arena, they must take computers to a higher level.

Thanks for the comments about the show, Ian. I had heard it had the makings
of a good one and it's great to see it came out that way. The MIST show in
Indiana here in the US also turned out very nicely, although lots smaller.

Indeed, it is very good to know that what developers and publishers left
still support the Atari lineup with such fervor.

But why in the world wasn't HiSoft represented? They LIVE there, after all!

Cheers,

> should be under $500.

Gee. Where have I seen a description like this before? Sounds like the original ST concept to me. A low-cost (<$1000) computer that current/former 8-bit and/or game machine owners would by, easy enough for a child to use, and based on the (then state-of-the-art) 68000 processor. Yep! That's a 520STfm alright (other than the CD-ROM, i.e.).

Atari probably never realized how much their consumer-oriented machine could do. But then along came Calamus and PageStream, and blew Pagemaker out of the water, not to mention the scores of MIDI users (not a month goes by that I don't see an ST in the background in a shot of a famous musician in the trade mags). Seems to me that Atari had their bread buttered and ready, they just didn't follow through with it. Sure, the Falcon's great! but that was the end of the line. Meanwhile Apple and IBM kept going, incrementing their 680x0 and 80x86 processors and adding more powerful and compatible peripherals while Mr. T was grandstanding instead of pouring in the profits.

Why can't somebody explain to the suits at Atari that although they're behind currently, with a little work, they could build the best machines around?

With what money? For a company that expects to make a big splash in
the consumer electronics market, they are practically broke. Building
PC's/game consoles costs money. Advertising costs money. R&D costs money.

If Atari introduced a machine that was 10 times faster than a PowerMAC
at half the price, they still couldn't sell any because they can't even
afford to tell people about it.

I think the "suits" have figured that out (after all this time) and have
decided to concentrate on a market where they can possibly use their
name recognition to their advantage. Playing Don Quixote with the
personal computer market only weakens them further....

The computer business is over for them. Time to move on...

>layer?

Well, they could start by making the system board the size of a standard PC board, then they could take whatever computer case and plug the thing in. There would be room for CD-ROMS, Tape Streamers, Harddisks etc. A decent power supply is standard in every PC case so there will be no messing about with 'lame' power supplies.

As for architecture:

Let them set up a modulair system with 3 or 4 processor slots so people can decide what processor to plug in to run the software they need (or already have).
Make the whole I/O and memory mapping programmable (a sort of RAM based GLUE) so the whole construction is configurable by software. If you want to have a PC, just run the 'set hardware to PC' program and away you go, just run the 'set hardware to Atari ST/STE/TT/Falcon' utility and it's a truly compatible Atari.

The bus expansion system could be made in a similar way but the main thing is that the machine should be 'upgradable'. Us Atarians hate the PC world but fact is that through the PC systems modularity it can be turned into almost anything. If you want to have sound, plug in a sound card, if you want to have better sound, plug in a better card...

Only problem for all of this is that I don't think Atari will ever enter the computer market again, especially not when the Jaguar is going to be a hit, they will just 'invent' a better game computer next time.

Gert

1702. Re: Atari/Amiga Article in EM

Newsgroup: comp.sys.atari.st
Date: 1994-08-04 22:09:09 UTC
From: healy@nosc.mil
Message-ID: <1994Aug4.220909.2516@nosc.mil>
Source record: 182660

Yeah, the EM article seemed to have a reasonable tone, except that it gave the impression that Atari once supported its customers and doesn't anymore.

I think I'm getting close to the same level of support from Atari now that I was when I bought my 1040st in 1987 :-)

Mike Healy

healy@nosc.mil

1703. Re: NEC CD-ROM drive

Newsgroup: comp.sys.atari.st
Date: 1994-08-04 22:14:59 UTC

>a NEC CD-ROM drive to an ATARI ??. The drive in question is a

I have a NEC CDR-37 attached to my MSTE. I use an ICD host adaptor and the ICD Pro CD-ROM.XFS under MiNT 1.04.

AFAIK, MetaDOS *only* works with either:

a) Falcon
b) TT
c) Genuine Atari CD-ROM drive.

You don't have (c), so if you don't have either (a) or (b), then you've got a problem ;-)

Most people seem to reomend ExtendaDOS as a decent CD-ROM driver. Its supposed to be better than the ICD one I'm using.

As for playing audio CDs, then there is a shareware program AUD_CD20, which can be coaxed into playing audio CDs on a NEC. You need a config file (which isn't supplied.) This program is also AFAICR ST only (no TT or Falcon). Also I don't believe it is supported as shareware any longer as the next version has gone commercial.

The commercial version - AUDIO CD-MASTER 3.0 is better, and has the NEC config file supplied. Even so, I can't get all the features to work on my (admittably pretty obsolette) drive. Its probably my drive at fault.

There's a FAQ around here somewhere, and I can supply some more details if you want, although I'm away on holiday next week.

:-)

>>ICD harddisk driver (I have been told that it is sufficient to turn of the I
>>cache).

I seem to have missed the original of this message, but would be very interested in hearing some more about Outside on the PAK. I'm planning to use the ICD drivers so a possitive test would be *very* much appreciated.

Also How much memory do you have, and have you tried MiNT and/or GCC in it?

I'm *seriously* considering a PAK3 for my MSTE, but want to be sure of the Outside aspect before I buy. Mainly because I want Virtual Memory as well as speed.

Finally when you say the HDDRIVER is supplied, is it on the install disk or what?

Thanks

Roland.

>commercial and you bought it from a store, so it is still a deal.

My point was rather around spending money which the author wont get.
Spending 5 quid on a game like Starball is a good deal, but spending 10 quid
just to transfer the 5 is pretty stupid in my opinion. I would rather give
him 15 quid personally.
But i will hopefully work out a better solution. Maybe by collecting those
who want to registre from Denmark, all in one go.

>One of my beta testers has a Falcon030 w/ TOS 4.02 and 4 megs. However what

I know it may be difficult to work for an machine you don't have, but i think
there is a need for it. (Hmm! i just saw a message from you in where you told
how many, or should i say less, people who have registred. Maybe it's not such
a bad need after all).

>What do I need to hook my Falcon to an Ethernet connection?
>Do I need special terminal program or somesuch?
>tia.

At the moment the only option, I've been able to uncover would be to get the tuw-tcp software off of a.a.u.e. in Networking/EtherNet or at ftp.tu-clausthal.de under Telcom/tcpip (i'm not 100% certain on the second). Inside this kit is documentation on how to build an adaptor for the cartridge port and source code in C for a driver for your ethernet card. Unless you get 1 of 2 cards listed in the kit you will need to edit this driver and recompile it to use on your card. Then you just need a network to plug into.

The other hope would be to either write yourself or find some kind soul to write a SCSI device driver for Mint. If we had this you could get practically any SCSI ethernet card and plug and go.

Hopefully some other kind soul out there will read this and tell us all of some easier way to do this... but don't get your hope up. If you had a TT you could look around for an old Riebl card. Look in the TCPIP.FAQ on a.a.u.e. in it you will find the adress of the person who was at last search maintaining the tuw-tcp code. He might have some new info by now.

Hope this helps,

Dan Ackerman

>mutations! Not sure if it attacks HDs.

According to the Oregon Research add for UVK 6 in the TOAD Computers catalog, only UVK 6 can recognize the Beilstein virus, which was discovered in March and is a "MS-DOS-mimic virus."

...places itself on a disk under the guise of an MS-DOS boot sector such as the one formatted by TOS 1.04 and higher. In addition to this, it uses a variety of methods to evade "Virus Probability Factor" algorithms, and exists in a total of over 650,000 versions that do the same thing but look totally different.
The Beilstein virus includes TWELVE destruction routines. These vary from clearing hard disk partition C and reseting the computer to deleting files after the user loads them and corrupting screen/printer/modem output. Due to a rather devious system involving the buffering of the original boot sector, your disk can be said to be virus-free even after being infected with the Beilstein virus. Note that the Beilstein virus cannot yet be recognized by ANY other virus killer!

Sounds like a good reason to out and buy the Ultimate Virus Killer. If I didn't know better, I'd think Oregon Research had concocted the virus just to sell their UVK 6! :-) Of course, their an excellent company, and I don't want anyone to think that I actually think that.

FWIW,
Tom

: Word has it that NVDI 3 is several *times* faster than Speedo 5, which
: will be very nice!

: Speedo 5 is out *now*, NVDI 3 will be out in about 2 month: --
: --Chr

Going back to the original topic, That's Write 3 is the only word processor
that has true PostScript output (uses PS fonts).

SpeedoGDOS 5 does not include a PostScript driver, but one may be made in
the future.

As for comparing NVDI 3 and SpeedoGDOS 5, NO ONE has used both yet, so who
is saying NVDI is "several times faster"? It may be, but it's awfully
unlikely. SpeedoGDOS 5 has new output routines, and will actually work with
NVDI if it's installed, throughput is up to 600% faster than SpeedoGDOS 4.x.
That's for real (as opposed to "word has it"-vaporware-rumor mill kind of
stuff).

Besides, it isn't completely fair to compare them at all; NVDI is a screen
accelerator that can scale (some formats of) fonts. SpeedoGDOS 5 is a
type scaler that has some screen acceleration. We asked ourselves, how would
one get the the best system/performance, and the answer is with
SpeedoGDOS 5 and NVDI (any version) together. SpeedoGDOS 5 sets a new
standard for type scalers (in supporting all major font formats and
killer performance) and by using NVDI for some display routines, you get
capabilities and performance that outstrip one or the other alone.

I'm sure that STZip can read it's self-extracting archives, and I think
it can rewrite them as well. I thought LHArc did this as well?
The header added by STZip is pretty small.

> Furthermore, they don't profit from new packer/depacker versions. If I

Ummm... Okay, you've got a point :-). But as long as they're
readable anyway, no probs.

The only problem is working out _what_ they were packed with.

From: aspect@cats.ucsc.edu
Message-ID: <31sgdd$s17@darkstar.UCSC.EDU>
Source record: 182748

In <776046594snz@theshack.demon.co.uk> frank@theshack.demon.co.uk (Frank Charlton) writes:

> Does anyone know of an ftp source for SpeedoGDOS/Bitstream fonts?
>I've seen the small selection on umich, and I was wondering if anyone
>had come across any others?

Speedo fonts are all commercial. There are no freeware fonts. There are
free GDOS bitmap fonts, though. If there really are speedo fonts on Umich,
they are either impressive hacks into the speedo font code (you see, speedo
does not release font specs or editors for people to make their own fonts)
or illegal copies.

If you want PD fonts, you can upgrade to Speedo 5.0 which uses TrueType and
Postscript type 1 fonts in addition to Speedo fonts.

Yes, Pure C does work under MultiTOS (including the libraries and better support for the new AES v4.2). It was released and is available from Gribnif.

And I did hear that they [ASH] are working on a new release that will no longer carry the Borland copyrights.. I have not heard anything beyond that.

I hope they release a C++ compiler; I'm still waiting to upgrade to their next release.

Hope that helps.

I can't see how it can, the Megafile 30 uses RLL drives, not easy to come buy these days..

The Atari utils can be used with any MFM/RLL drive you just enter the details into the Windcap file....

-> I think there is an IDE adaptor out
-> or out very soon. One is on the way at least. In the UK you can buy complete ST
-> hard drives for a little under 200GBP.

There is a IDE adaptor available from Hard & Soft in Germany. I is a combined interface and TOS upgradeboard. You will need TOS 2.06 to run HD with this so there really isn't any option on the TOS upgrade. But I won't complain. I lived with TOS 1.2 before buying this interface. ;-) There is a switch that makes it possible to switch back to your old TOS if you have to. But then you can't access the HD anymore. :-P

The board require some fiddling (sp?) with your machine but no excessive soldering, unless you have a soldered CPU like I have. Then you have to solder a socket on the CPU, or alternatively, desolder the CPU and solder the socket to the main circuitboard. The upgradeboard rides piggyback on the CPU.

If you have socketed CPU (like the large majority has) then it's only a handfull of wires to solder to various places on the main circuitboard. None of these any hard if you have a little experience with soldering. Be prepared that if you have the CPU under the keyboard, then it can be difficult/impossible to put the shielding and the keyboard back again. I have this problem due to the extra height caused by soldering a socket on top of the CPU.

Cost? Well here in Sweden I had to pay ~1800 Sek (~ £150) with TOS 2.06 chips,
but I recon that in GB it costs/would cost a _lot_ less.
(guess who is drooling over the ads in the english ST mags? ;-))

1732. M-disk virus ?

Newsgroup: comp.sys.atari.st
Date: 1994-08-05 12:14:19 UTC
From: Bales_N@CIRAD.fr
Message-ID: <9408051904.AA00085@montp.cirad.fr>
Source record: 182667

CEO file contents:
Hi,

I think I've got a little virus problem on my floppies :

I use regularly a nice little .ACC called MDISK, which is a sizeable ramdisk with disk copy, format and virus options. I got this on a french ST Magazine's cover disk over a year ago, but have been using it since I upgraded to 1Mb.

Now, I've discovered that a lot of disks formatted since then are infected by a virus which is detected by M-disk and seems to spread quite easily as I generally use M-disk for copying files/disks.

What I'd like to know is if anyone has been experiencing the same kind of problem with M-disk. Could this program be generating a virus on my floppies ?

I'm not accusing anyone, but I never swap disks with any other ST, so I really don't see where else I could get this virus from. I also transfer ftp files from a PC to my ST, but I don't believe there is a virus that can jump platforms like that. Or is there ?

Additional question : which is the best/latest anti-virus ?

Thanks,
Nick

Bales_N@CIRAD.fr wrote:
> I think I've got a little virus problem on my floppies :

It is likely that most ST users have lots of occurances of the Signum/Key virus. It is the most common one encountered on STs. Fortunately, it is also harmless (though that could change if anyone every releases a payload portion to the virus - it was designed to come in two pieces).

Interesting sub-note: The Key virus does not work on TOS 2.06, it causes bombs when trying to boot the floppy. I was quite surprised to find that many of my floppies did not work in my new MegaSTE, and was then even more surprised that I had the Key virus all over the place (even after wiping it out years ago, or so I thought). The Vkiller virus package fixed the problem for me.

It is possible that MDisk is the culprit, but have you checked your boot disks with Vkiller or similar? If not, Vkiller is available on atari.archive.

> platforms like that. Or is there ?

If you have ever received a disk via the MSA format, it will quite happily spread bootsector viruses. Also, viruses have been found on numerous commercial and PD library disks. Even one such occurance can spread the virus to a regularly used disk, and the next thing you know you're ass-deep in the things.

> Additional question : which is the best/latest anti-virus ?

The best/latest is probably Sagrotan, a German shareware product. It can detect boot sector and link viruses. It is totally in German, and a bit scary to use if you don't understand this language, but with a bit of careful experimentation it will work fine. In addition, Vkiller is very good. It concentrates on boot sector viruses, but these are by far the most common

on the ST.

Source record: 182690

Myrddin:

For starters, if Atari decides to make a bigger re-entrance back into the computers, they should advertise. If not in a big saturation campaign, then at least in the niche markets that we know are its strong points (MIDI, desktop publishing).

I realize, though that a big advertising campaign requires big bucks - funds which Atari may not have or be unwilling to release. They should look into doing co/operative ads again with the software and hardware companies that make products which enhance their products - that was a very good idea they had when they did the co-op ads with C-Lab and Fostex a few years back, and should continue to pursue.

Although television ads may be out of the question (again, big bucks here), radio ads would be a great idea, as the amount for radio spots isn't as big. Atari did that in Canada a few years back by doing radio spots for their computers (the famous "Atari SHATTERS THE MYTH of high costs for computers!") And it worked - at least I bought one as a result of having it brought to my attention :)

And the ads MUST MAKE SENSE! They must also be NO NONSENSE, STRAIGHT TO THE POINT ads. Nothing like those rather dumb ads they did for the Falcon in Britain which made it confusing what the Falcon actually did - they wouldn't even show the computer in it like they were ashamed of it or something.

A good point of reference would be the ads Volkswagen of America did in the 1960s to promote their product - they were straightforward, well-produced, and told the consumer exactly what they needed to know, no sugar-coating. They also had a neat sense of humour about them.

As for the computer side? Well, a faster processor definitely. What with all the talk about the Power PC, they should look at the possibility of producing a TOS-compatable Power PC-based unit. (and apparently Atari has been thinking about this). The graphics engine should definitely be based on what they've learned from the Jaguar - that would be one happening machine!

And a nice case with separate keyboard for it - and a good keyboard at that. Make it so that peripherals could be added easily to it - perhaps four-to-six slots for add-on cards. Standard SCSI II/LAN ports. MIDI ports we'll DEFINITELY want :)

And a redesigned, proper, FUNCTIONAL mouse! 400 DPI! I mean it!
The plastic used to make the standard Atari mouse would be put to
better use as an offshore oil slick. :)

... Captain! There's a tribble on your head! Oh - that's your hair.

Kevan> What do I need apart from the HD ? Can I use IDE drives or what ?

You can use IDE drives on some of the newer Ataris, I believe. For the
older ones, you need a "host adapter" to attach a SCSI disk to the ACSI
interface. These come rather cheap nowadays, and you need only one to attach
up to 8 devices (hard disks, CD-ROM, tape, whatever).

A popular brand of host adapters is ICD, but there may be others.

Hope this helps,

Jens.

I have the following computer items for sale that I do not need anymore:

ATARI ST SOFTWARE:
==========

Flight Simulator II (Atari ST TOS 1.4 version) $15
Michtron Super Conductor MIDI sequencer $ 5
GST C compiler $ 5
MIG 29 Fulcrum fighter simulator $15

Computer Equipment:
==========
NEC PC88 8088 Basic OS computer (ancient) FREE
Epson dual 300K 5 1/4" floppy (you pickup)
daisy wheel printer
NEC analog monitor

digital VT320 terminal SOLD)

Miscillaneous:
==========

TACTEC/TACTEL 6 channel ~450 MHZ xtal FM HT (rough exterior) $15
(have not personally tested - got two, need only one)
will throw in assorted business band xtals
no antenna (BNC style connector)

JVC VCR with bad motor. (will not engage on Play) $OFFER
4-head top eject (fisher price buttons ;-)

IBM Compatible items:
==========

Intel '83 C80287-3 mathcoprocessor $ 5

8-bit MFM controller card $ 5

42 Meg MFM Hard drive and 8-bit half-card controller $45

AST Advantage (TM) card ser/ser/par/game/memory card $10
0.5 meg installed - either 4164 or 41256 to 3 Meg
Original manual + AST BBS files

Magitron 2.5 meg memory card (41256 only) $ 5
1.5 Meg of 41256 chips +$15

BOTH $15

AST SixPakPlus memory/ser/par/game/clock card $ 7
64K to 1088k (128K installed)
AST BBS info files (configuration information)

National Semiconductor QuadFAX-96 9600 baud fax-only card $20
Original manual and software
On all items buyer pays shipping. All items, to my knowledge, are in
working condition unless otherwise stated. Interested buyers can reach
me via the phone at (810) 394-0351 or on the internet via swood@oakland.edu.

swood

Picswitch does conversions, but I'm not sure about the sizes you mention.
It is on atari.archive.umich.edu. I believe you want picsw7.arc (not
picsw101.lzh) in the /Graphics directory.

r> 1. Atari should concentrate on the Jag. When (if) Atari becomes fat from
r> fees from game makes, then look at computers again.

What makes you think that Atari will or should do that? If Atari
succeed in the console market then they should stay there ,and make
progress there rather than coming back to the computers. A new
TOS computer won't do anything at all ,as it will just be an ST.

As long the future of TOS machines goes ,Falcon is still a new
machine and other 'clones' have also started to appear (licensed
by Atari) which means that we may still see better TOS -based
computers coming in te future ,even if the the Atari support
becomes very low.

1745. Harlekin (the game) help needed

Newsgroup: comp.sys.atari.st
Date: 1994-08-05 16:33:23 UTC
From: morisset@ERE.UMontreal.CA
Message-ID: <Cu2Lzo.4wv@cc.umontreal.ca>
Source record: 182683

Does this group answer questions to atari computer games (not video), if yes, there is my problem: In Harlekin, from Gremlin, i passed the straws screen, arrives in heaven, but cannot go anywhere because of the lack of platforms. What am i to do?
In bonus, if someone knows where i can find complete solution for Hound of shadows by EA, and Legend from Mindscape, i would be eternaly grateful

Thank you very much to all Atari fans...

1746. Degas Elite Format...HELP!

Newsgroup: comp.sys.atari.st
Date: 1994-08-05 16:39:52 UTC
From: eliassen@aviris382.jpl.nasa.gov
Message-ID: <eliassen-0508940839520001@avirislab.jpl.nasa.gov>
Source record: 182698

Does anyone have a utility that will convert a .NEO picture into a Degas Elite .PI1 picture? The problem lies with most programs saving "Degas" files as ~32034 bytes. I need a Degas Elite format which saves as 32066 bytes. Any help would be great.

Thanks.

Brian

: >had come across any others?

: Speedo fonts are all commercial. There are no freeware fonts. There are
: free GDOS bitmap fonts, though. If there really are speedo fonts on Umich,
: they are either impressive hacks into the speedo font code (you see, speedo
: does not release font specs or editors for people to make their own fonts)
: or illegal copies.

: If you want PD fonts, you can upgrade to Speedo 5.0 which uses TrueType and
: Postscript type 1 fonts in addition to Speedo fonts.

What about the X11 bitstream fonts? Was Speedo ever fixed to allow
thease to be used? I think there was also a special price set for Word
Perfect It wasn't free but it was damn cheep.

Dave.

You seem to be well informed... how about 32 bit integers ?
I know one can always define long's, but there are plenty of Unix software
that assumes that int==32 bits. If the new version can treat ints as 32
bit, I will buy it immediately because of its compilation speed. But for
now I stick with gcc.

PFXPAK.TTP, it's based on LHARC with a fast build-in run-time depacker
(works with alle program, and not just "demoes" and special things).

Move somewhere cooler ?

Sorry ! <g> It sounds as though the moisture in the air is condensing on either the ball or the rollers. Hmmmmm. Pointing an electric fan at the mouse might help, but if the humidity is 90%, then the air won't accept the moisture back !

Sorry, can't think of anything useful apart from that !

Good luck.

Maybe I wasn't clear! IT COSTS $100 TO GET INFORMATION FROM BRAINSTORM ON
THEIR DSP JPEG DECODER. I.E. $100 to be a "developer" for their decoder.

Anybody have an address for Brainstorm?

-Stuart
